8. CONCLUSIONS

EXECUTIVE SUMMARY

This study explores consumer behavior in the luxury fragrance market, focusing on Dior Parfums. Using a structured questionnaire, 209 responses were collected across Milan, Rome, and Vicenza to support Dior's strategic marketing decisions. The analysis follows a rigorous quantitative approach, structured into five key stages:

1) Sample Profiling

- The sample includes both users and non-users of perfume to ensure representativeness. Although gender and occupational distribution align well with the real population, discrepancies exist in age (younger respondents overrepresented), location (Vicenza overrepresented, Rome underrepresented), and education (university graduates overrepresented). These biases must be considered in interpreting the results.

2) Consumer Habits and Preferences

- Perfume use is widespread and habitual: over 80% use it multiple times a week. Consumers prefer medium-to-large sizes for practicality and cost-efficiency. Fragrance notes and longevity are the top purchase drivers, while price and emotional aspects like memory-evocation play secondary roles. Preferences for scent types are evenly distributed (floral, citrusy, woody, etc.), suggesting market openness to varied olfactory profiles.

3) Willingness to Pay and Perceived Value

- Most consumers are willing to spend up to €100 on a fragrance, with €90–100 being the most frequent range. A moderate negative correlation exists between price sensitivity and spending, while a weak positive link is observed between perceived fragrance importance and higher willingness to pay. Longevity and exclusivity (e.g. niche brands) enhance perceived luxury and partially justify premium pricing. However, brand loyalty—even to Dior—does not significantly impact willingness to pay more.

4)Shopping Preferences and Emerging Trends

- Physical retail dominates (86% preference), driven by the ability to test perfumes and receive personalized advice. Online shopping appeals to a minority (14%), mostly due to convenience and discounts. Consumers value refillable packaging and allergen-free formulations, though willingness to pay more for sustainable or genderless products remains limited but growing. Social media plays a secondary role; Instagram is the most cited platform, yet peer recommendations remain the most trusted source.

5) Brand Positioning and Segmentation

- While 85.1% consider Dior a luxury brand, only 41.4% have used its perfumes, indicating a conversion gap. J'adore is the most recognized product, followed by Miss Dior and Hypnotic Poison. Net Promoter Score (NPS) is slightly negative (-5.1%), suggesting a need for improved customer experience and loyalty strategies. Cluster analysis identified four distinct consumer segments based on attitudes, preferences, and values, which can guide personalized marketing efforts.

RESEARCH GOALS & QUESTIONS

UNDERSTANDING CONSUMERS PRIORITIES

Which are the main drivers influencing the choice of a luxury perfume?

We analyze sensory, emotional, and brand-related attributes that guide consumer preferences.

EVALUATING CONSUMERS PRICE PERCEPTIONS

How much are consumers willing to pay for a premium fragrance and which elements influence their price perceptions?

We investigate perceived value and the trade-offs consumers consider when choosing premium fragrances.

EVALUATING THE IMPORTANCE OF TRENDS

How significant are emerging trends in consumers choices?

We explore how emerging trends influence consumer choices, from sustainability to digital experiences and personalized scents.

EXPLORING GROUP DIFFERENCES

How do attitudes and behaviours differ across consumer profiles?

We assess the role of demographics (age, gender, education, employment) and habits (channel, frequency) in shaping perceptions.

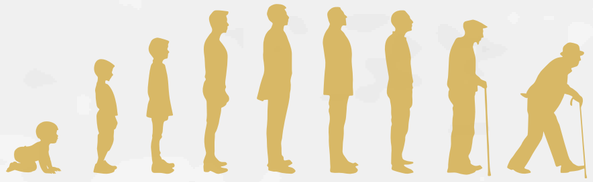

1. SAMPLE DESCRIPTION

1.1 AGE
1.2 GENDER
1.3 LOCATION
1.4 EDUCATIONAL LEVEL
1.5 EMPLOYMENT STATUS
1.6 INCOME LEVEL
1.7 PARTIAL CONCLUSIONS

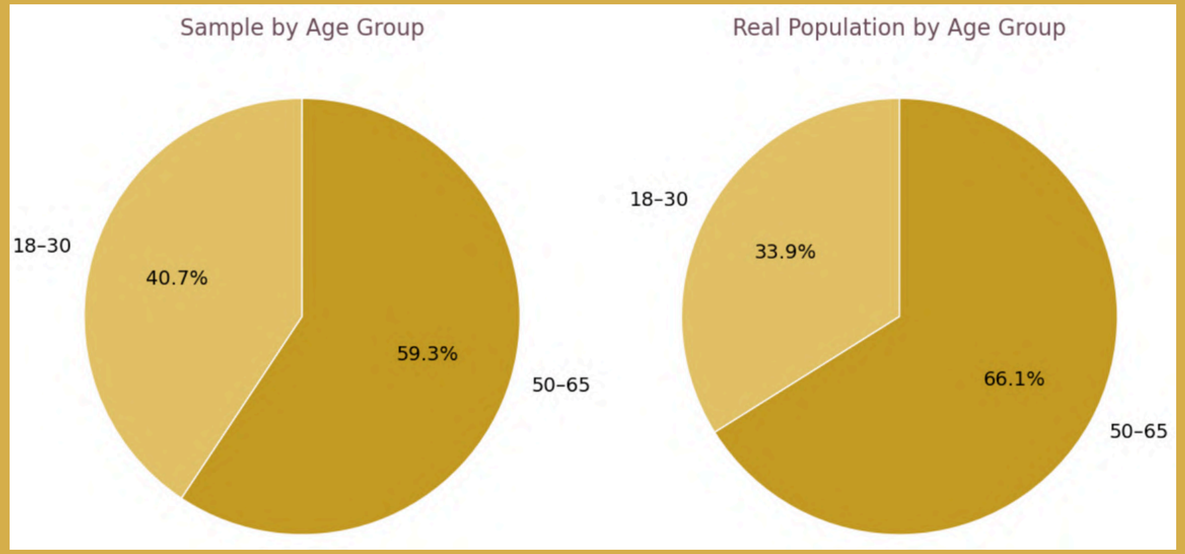

OVERVIEW

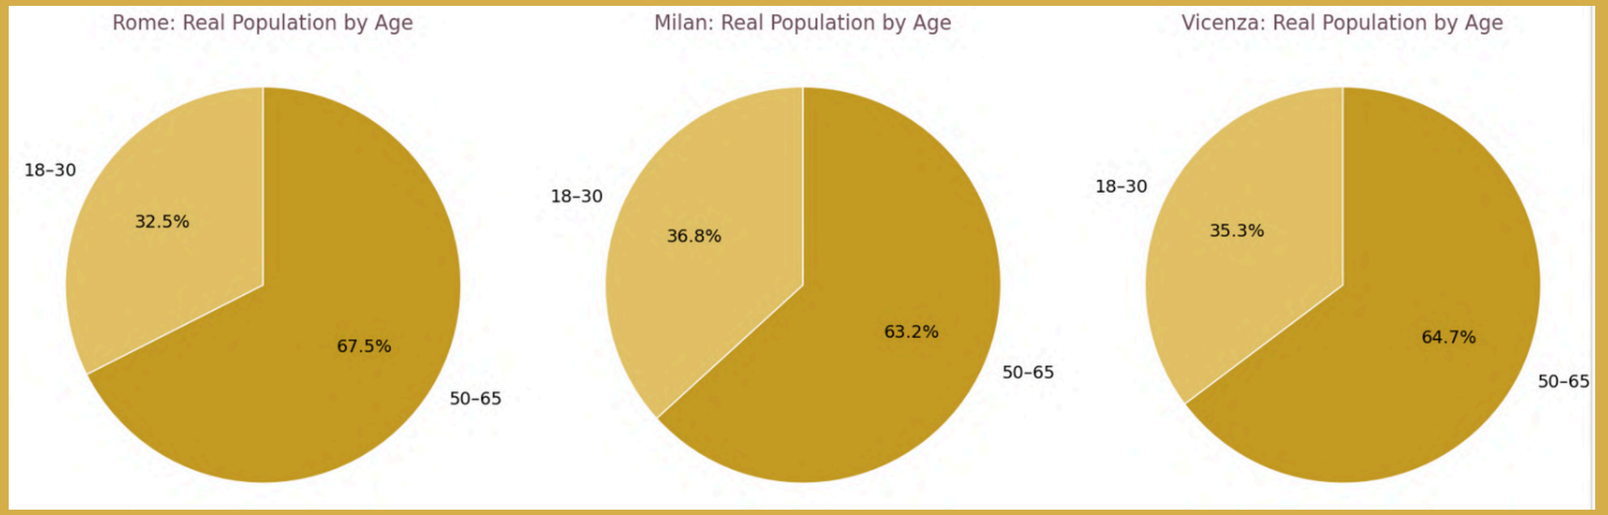

This analysis is based on a sample of **209 individuals** residing, working, or studying in the cities of **Milan, Rome, and Vicenza**. The sample includes participants from **two distinct age groups: 18–30 and 50–65 years old**.
The purpose of this section is to provide a detailed overview of the sample's demographic structure and to assess its representativeness by **comparing it to official population data**.
All respondents were included in the analysis, even those who answered "no" to the question "*Do you use perfumes?*". This deliberate choice aims to preserve the heterogeneity and **representativeness of the population**, rather than narrowing the scope to active perfume users only. Including non-users allows for a broader understanding of the population and captures the full spectrum of attitudes toward fragrance consumption.
To **evaluate the sample's alignment with the actual population,** comparisons were made with official demographic data from **ISTAT** (the Italian National Institute of Statistics).
These comparisons were focused on key variables such as age group, gender, and geographic distribution, with the goal of identifying any relevant discrepancies or sampling biases that could influence the generalizability of the findings. By doing so, this section sets the foundation for interpreting subsequent results with a critical eye, aware of the limitations and strengths of the sample composition.

AGE

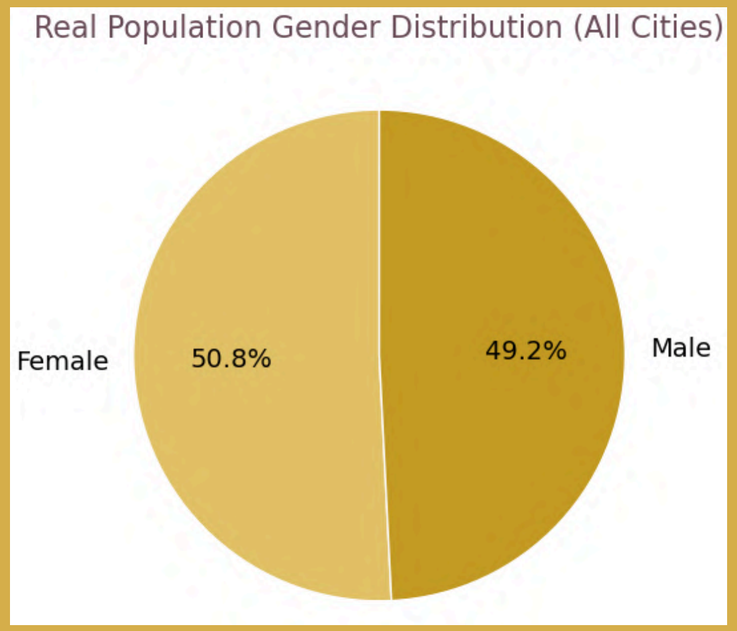

In Q42 the respondents were asked about their age. The **sample shows a moderate imbalance in age distribution compared to the real population** since **respondents aged 18–30 are over-represented** (40.7% in the sample vs. 33.9% in the population), while **those aged 50–65 are under-represented** (59.3% vs. 66.1%). This suggests the **sample slightly favors younger individuals, which may suggest that it may not be fully representative of the target population**.

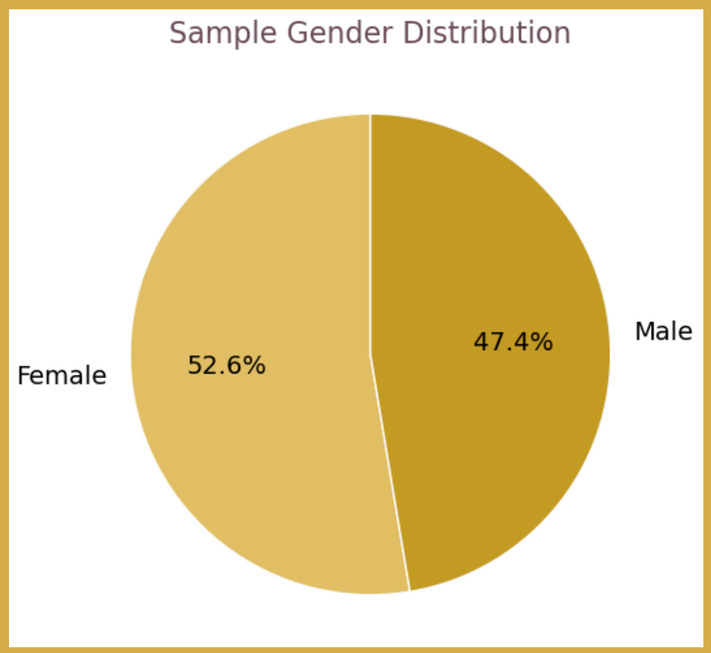

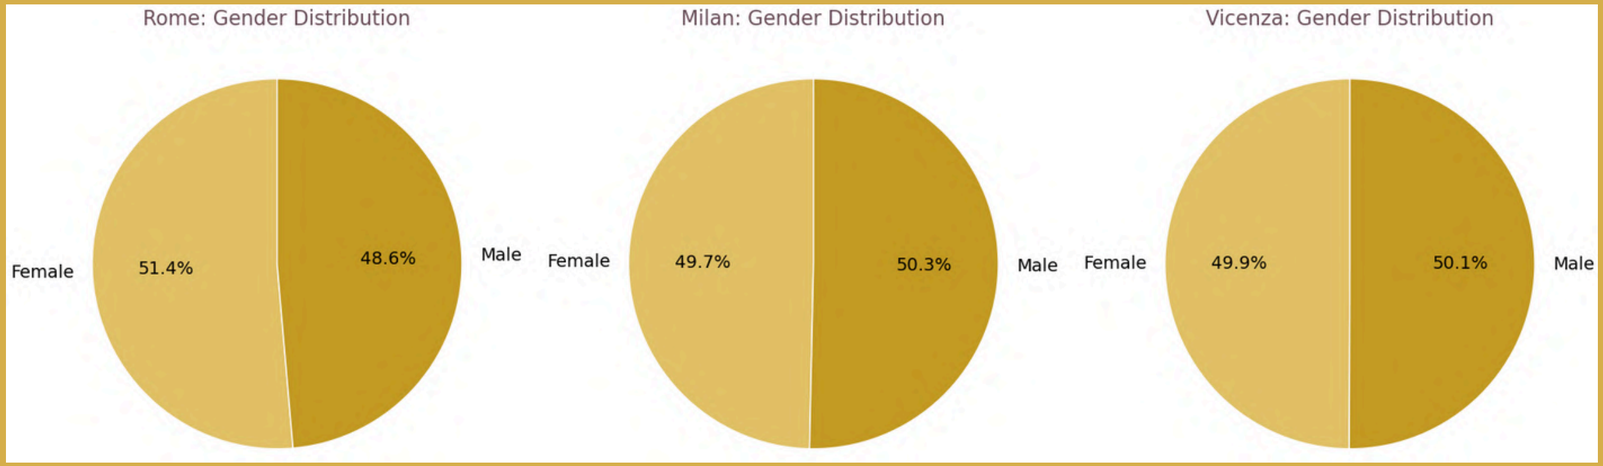

In all three cities, the **real population is consistently skewed toward the 50–65 age group,** which makes up about two-thirds of residents in Rome, Milan, and Vicenza. **The 18–30 group remains a minority across all locations**, ranging from 32% to 36%, confirming a uniform age structure among the cities with predominance of older residents.

GENDER

In Q41 the respondents were asked about their gender: the **gender distribution in the sample is very close to that of the real population.** Females account for 52.6% in the sample, compared to 50.8% in the real population, while males are 47.4% in the sample versus 49.2% in the real population. This **slight over-representation of females in the sample is minimal and unlikely to introduce significant bias**, as the distributions remain largely balanced.

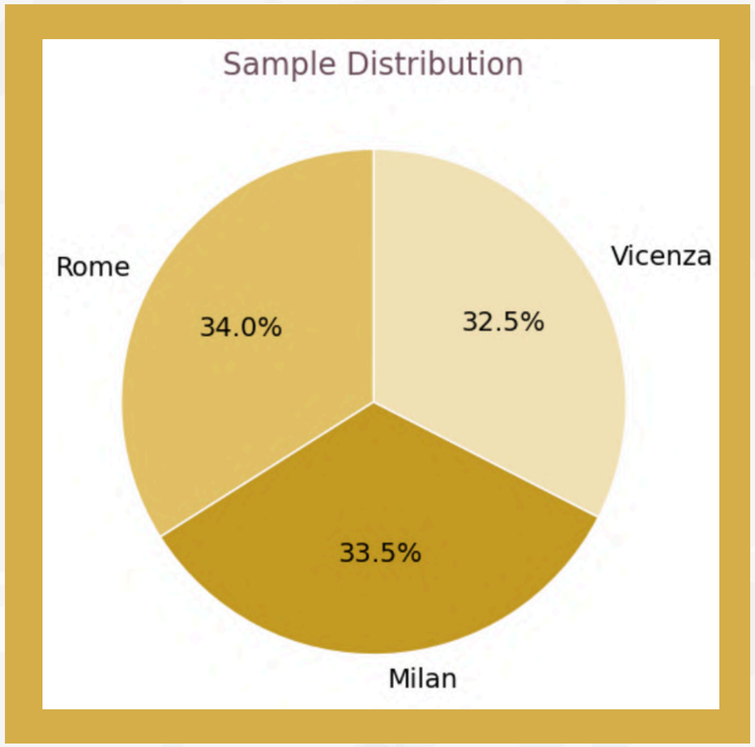

The **real population shows a consistently balanced gender distribution across all three cities**, with only marginal variations. Rome has a slight predominance of females (51.4%), while Milan (49.7% female) and Vicenza (49.9% female) show a very small predominance of males. **These differences are negligible**, confirming that gender is evenly distributed within the population across all locations

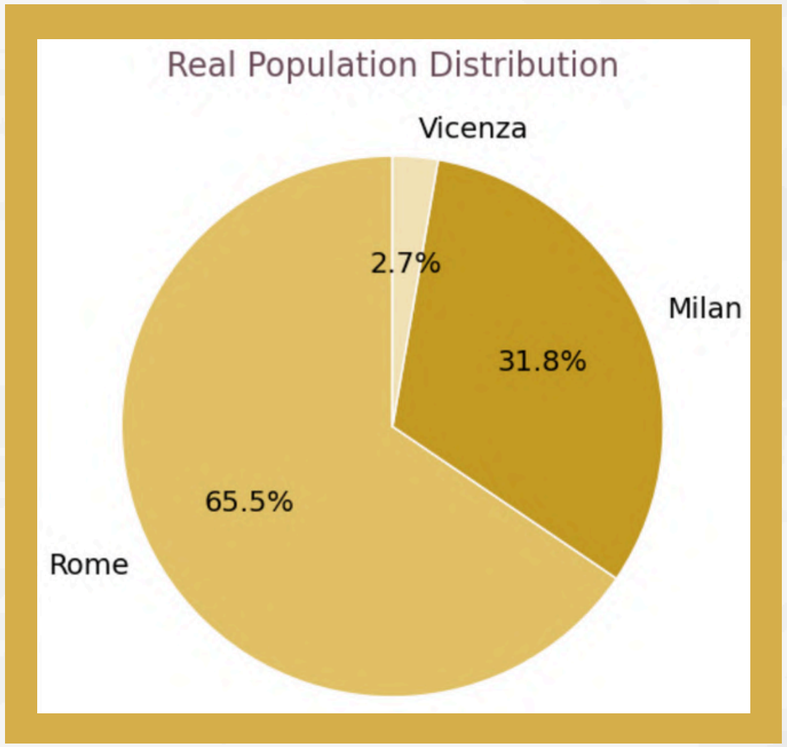

LOCATION

In Q45, the respondents of the questionnaire were asked wich city they lived, work or studied: **the comparison between the two distributions shows a clear misalignment** since **Rome** is **heavily under-represented** (34% in the sample vs. 65.5% in the population), while **Vicenza is vastly over-represented** (32.5% vs. 2.7%), and **Milan is slightly over-represented** (33.5% vs. 31.8%). This imbalance indicates that **the sample is not representative of the population**, and the **over-weight of Vicenza and under-weight of Rome could significantly bias the analysis.**

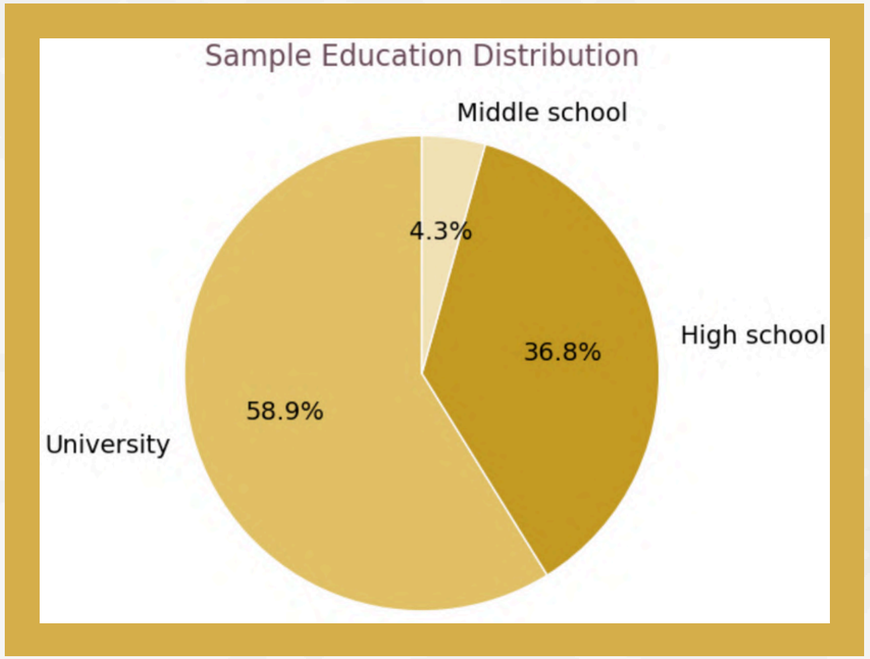

EDUCATIONAL LEVEL

The **education level distribution in the sample is clearly not representative of the estimated real population in the three cities and age groups considered.** In the sample, 58.85% of respondents hold a university degree, compared to estimated proportions of around 35–40% among 18–30-year-olds and 18–22% among 50–65-year-olds in Rome and Milan, and even lower in Vicenza. **This significant over-representation of graduates implies, by consequence, an under-representation of respondents with lower education levels**.

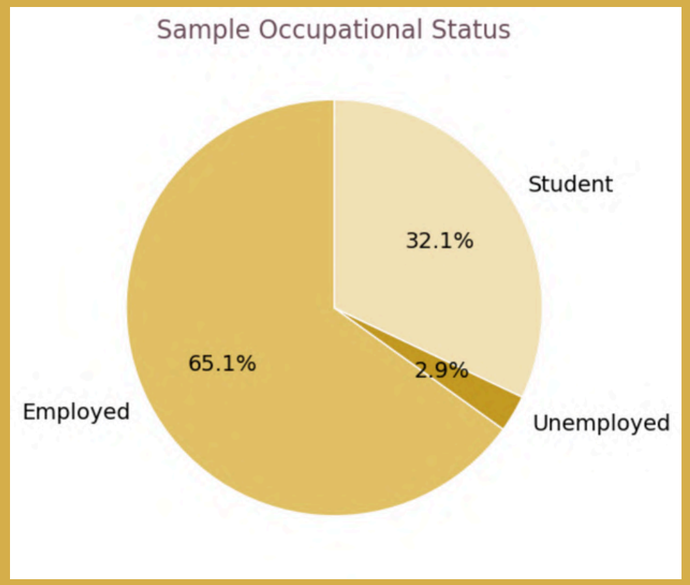

Therefore, **any findings related to education level should be interpreted with caution,** as the sample does not accurately reflect the real population structure, particularly for individuals with high school or lower qualifications**.**

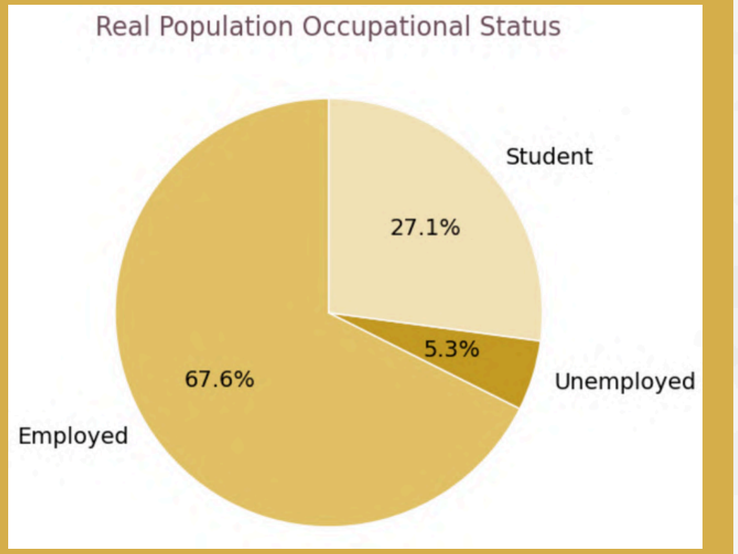

EMPLOYMENT STATUS

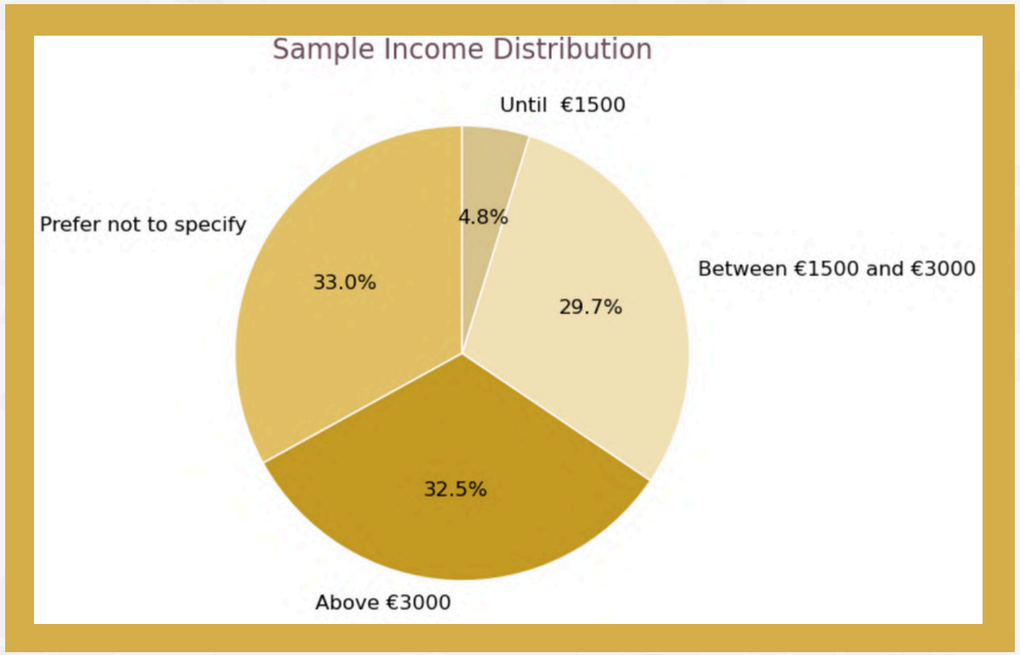

The comparison between the sample and the aggregated real population of the three cities (Milan, Rome and Vicenza) highlights some **notable differences in occupational status**. In the sample, employed individuals account for 65.1%, slightly lower than the real population estimate of 67.6%. In contrast, the proportion of students is higher in the sample (32.1%) compared to 27.1% in the real population, suggesting an **over-representation of students in the surveyed group.** Finally, the share of unemployed respondents is lower in the sample (2.9%) than the estimated 5.3% in the real population, **indicating a potential under-representation of unemployed individuals**. These differences suggest that while the **sample broadly reflects the occupational structure** of the population**, it** tends to **over-represent students and under-represent unemployed individuals**.

INCOME LEVEL

The analysis of income levels in the sample is **limited by the high proportion of respondents who chose not to reveal their income** (33% of the sample). Among those who did respond, the distribution is skewed toward higher income brackets: 32.5% declared earning over €3,000, 29.7% reported earnings between €1,500 and €3,000, and only 4.8% reported earnings up to €1,500. However, **due to the substantial share of non-responses and the lack of comparable detailed income data for the real population in the same age range and cities, it is not possible to draw a reliable comparison between the sample and the population.** The results should therefore be interpreted with caution and considered indicative rather than representative.

SAMPLE DESCRIPTION CONCLUSIONS

The analysis of the sample compared to the real population across the three cities (Milan, Rome, Vicenza) reveals a mixed picture of representativeness:

- On one hand, the **gender distribution is very close to the real population**, with females slightly over-represented (52.6% in the sample vs. 50.8% in the population) but unlikely to introduce significant bias given the overall balance. Similarly, the **occupational structure broadly reflects the real population only for the employed group**, while the sample shows a moderate over-representation of students (32.1% vs. 27.1%) and under-representation of unemployed individuals (2.9% vs. 5.3%).

- On the other hand, several dimensions indicate a notable deviation. The **age distribution is skewed toward younger respondents**, with those aged 18–30 over-represented (40.7% vs. 34%) and those aged 50–65 under-represented (59.3% vs. 66.1%). **The geographic distribution shows significant imbalance**: respondents from Rome are under-represented (34% in the sample vs. 65.5% in the population), while Vicenza is vastly over-represented (32.5% vs. 2.7%). Additionally, the **education level in the sample is clearly higher than in the real population**, with nearly 59% holding a university degree (far above the expected proportion) which implies under-representation of individuals with lower qualifications.

- Finally, the **income distribution could not be reliably compared to real population data due to a high share of non-responses** (33%); the results on income could be then considered as indicative only.

Overall, while the **sample** provides useful insights, its deviations in age, geography, education level and in part in employement status suggest that it is **not fully representative of the target population**, and findings should be interpreted with caution, taking into account the limitations that the analysis showed.

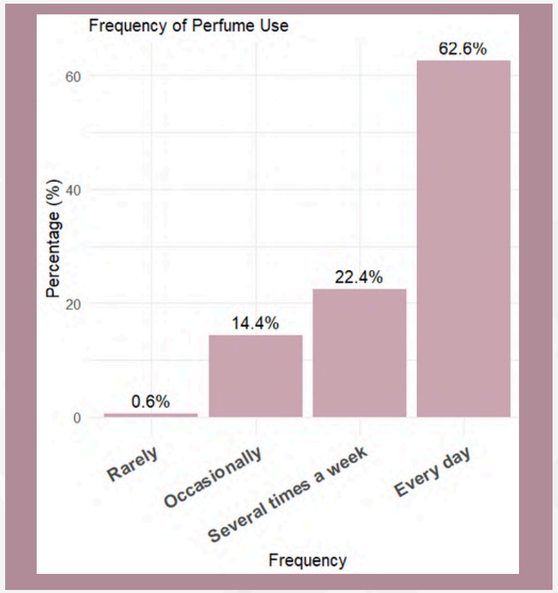

2. WHICH ARE THE MAIN FRAGRANCE CONSUMPTION HABITS AND DRIVERS INFLUENCING THE CHOICE OF A PERFUME?

2.1 USAGE HABITS
2.2 FORMAT PREFERENCES AND THEIR DRIVERS
2.3 FRAGRANCE NOTES PREFERENCES
2.4 DRIVERS OF CHOICE
2.5 PARTIAL CONCLUSIONS

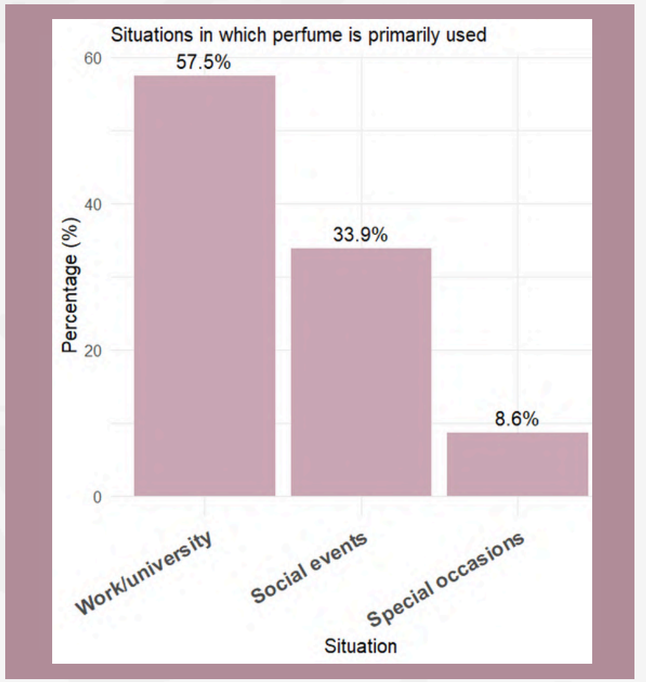

USAGE HABITS

	Cumulative percentage
Every day	63%
Several times a week	85%
Occasionally	99%
Rarely	100%

To begin with, we analyzed consumer habits related to **perfume usage**.
The first variable examined was frequency of use, and the results clearly show that perfume is part of daily life for most respondents. Around **80% use it multiple times a week**, with a significant **62% applying it every day**.
Only about 15% report using it rarely or only occasionaly, as it shown by the cumulative frequency 85% of respondents use it at least multiple times a week. This highlights how perfume has evolved into a **daily accessory**, not just a luxury reserved for exceptional moments.

	Cumulative percentage
Work/university	58%
Social Events	91%
Special Occasions	100%

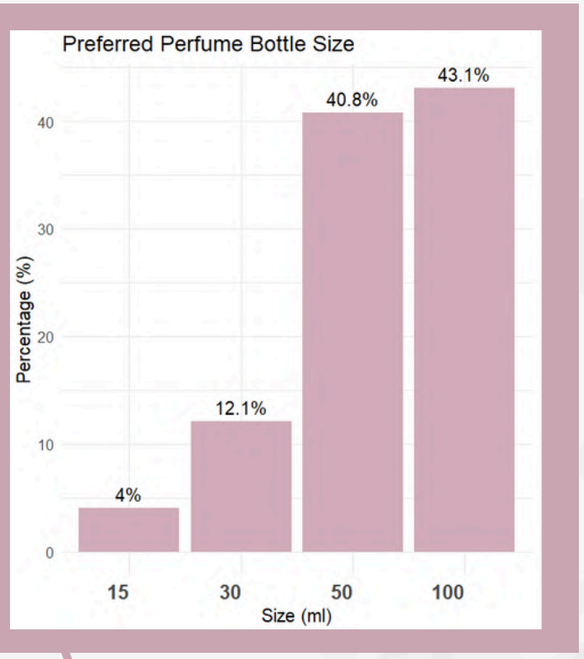

We also explored the situations in which respondents are most likely to wear perfume, distinguishing between work/university, social events, and special occasions.
Once again, the data aligns with previous findings: **nearly 90%** of respondents use perfume **for daily contexts like work or university, or for frequent social events** like during weekend or weekly events.
Only 8% report using perfume exclusively for special occasions, such as ceremonies, dinners, or formal events.
This confirms that perfume is no longer seen merely as a finishing touch for rare moments, but rather as a routine element in everyday personal care.

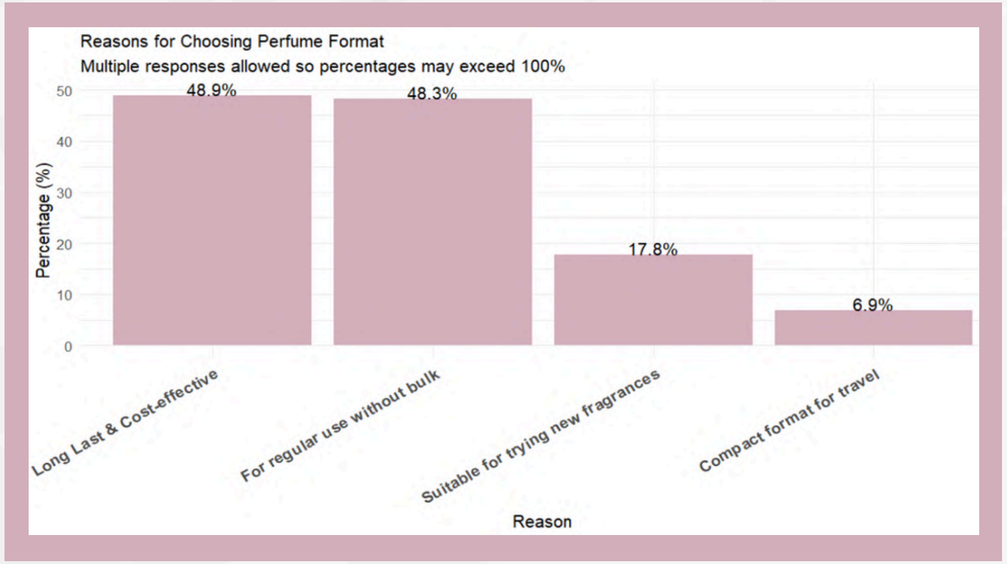

SIZE PREFERENCES

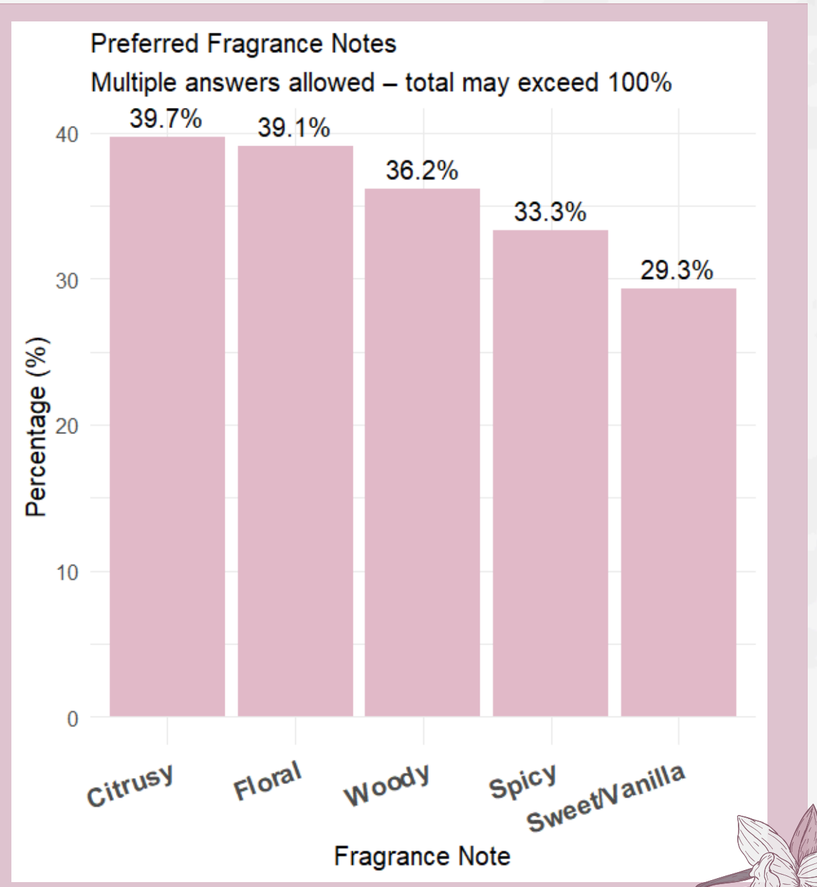

To deepen our analysis on product preferences, we examined which **perfume sizes** consumers tend to prefer.
The results show that **nearly 80% of respondents favor medium to large formats** (between 50ml and 100ml), while **smaller sizes are considerably less popular**.
This preference aligns with the earlier findings on frequency of use, reinforcing the idea that perfume is a daily product for most respondents, making larger formats more practical and cost-effective. But we can further analyse the reasons of this result using next question

The most cited motivations for a perfume format were **long-lasting use and cost-effectiveness (48.9%)** so the responders will prefers the biggest one **(100ml)** and the desire for a **practical format suitable for regular use without being bulky (48.3%)** this second level indicates a preference for **medium sizes.**
These results are fully consistent with earlier findings: perfume is not only used daily, but it is also expected to be **convenient, durable, and easy to carry**.
Less common motivations include the **need to test new fragrances (17.8%)** or to have a **travel-friendly compact format (6.9%)**, confirming that for most consumers, perfume is a stable routine rather than an occasional luxury.

FRAGRANCE NOTE PREFERENCES

We analyzed consumers' preferred fragrance notes to better understand **olfactory preferences** across the sample.

The most frequently selected notes were **citrusy (39.7%)** and **floral (39.1%)**, closely followed by **woody (36.2%)** and **spicy (33.3%).** Sweet/vanilla scents, often associated with niche or seasonal products, were also mentioned by a consistent 29.3% of respondents.

However, what's particularly noteworthy is the **lack of a clear dominant preference**: the distribution is remarkably balanced across all scent families.

This suggests that consumers are open to a wide variety of olfactory profiles, and may not have a fixed preference.

Such homogeneity offers a **strategic opportunity for further segmentation** for instance by gender or frequency of use to explore whether specific subgroups lean more strongly towards particular fragrance notes.

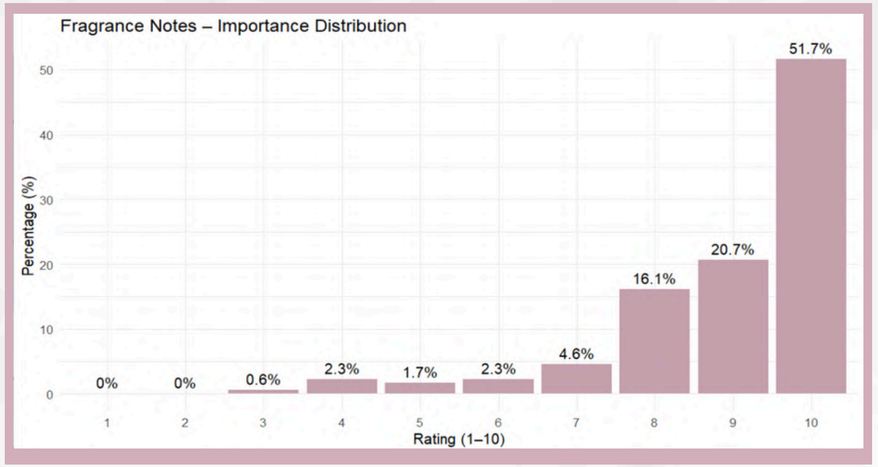

The plot shows how many people selected each fragrance as a favorite. Since participants could choose more than one, the percentages go over 100%. Each option works like a "yes or no" answer, either you picked it, or you didn't. Reported in the plot there is the percentage of "yes" for every fragrance note.

DRIVERS OF CHOICE

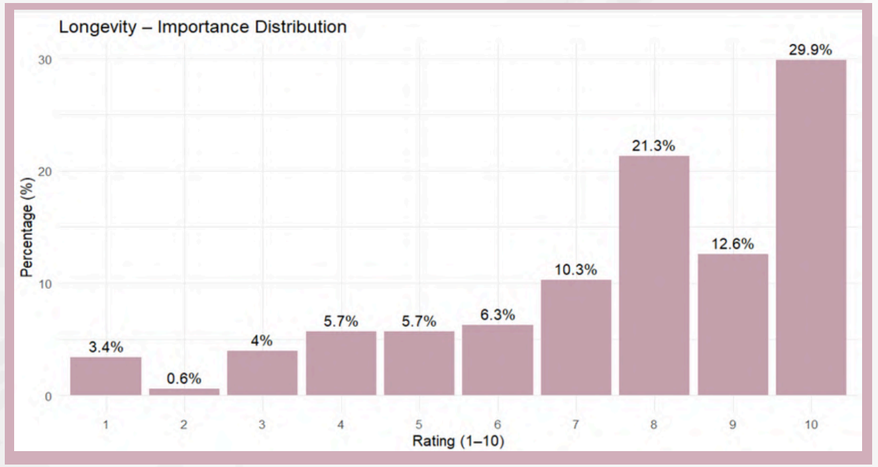

Factor	Mean	Median	SD
Fragrance notes	8.98	10	1.46
Longevity	7.61	8	2.43
Price	6.44	7	2.28
Evoking memories	6.03	6	2.89
Seasonality	5.52	6	2.85
Brand reputation	4.70	5	2.48
Sustainability	4.68	4	2.90
Personalization	4.64	5	2.95
Packaging	4.13	4	2.27
Unisex option	3.03	2	2.50

Participants were asked to evaluate the importance of ten different factors when purchasing a perfume, on a scale from 1 (not important) to 10 (very important). The table presents a statistical summary including mean, median and standard deviation. Among the various drivers influencing perfume purchasing decisions, fragrance notes and longevity clearly stand out as the most important factors.

We can explore the distributions of the most important factors using histograms:

Fragrance notes received the highest average score (mean = 8.98, median = 10), with **over half of respondents (51.7%) rating it as "10 – Very important"**. This reflects a widespread and strongly shared perception of the central role of scent identity in the decision-making process.

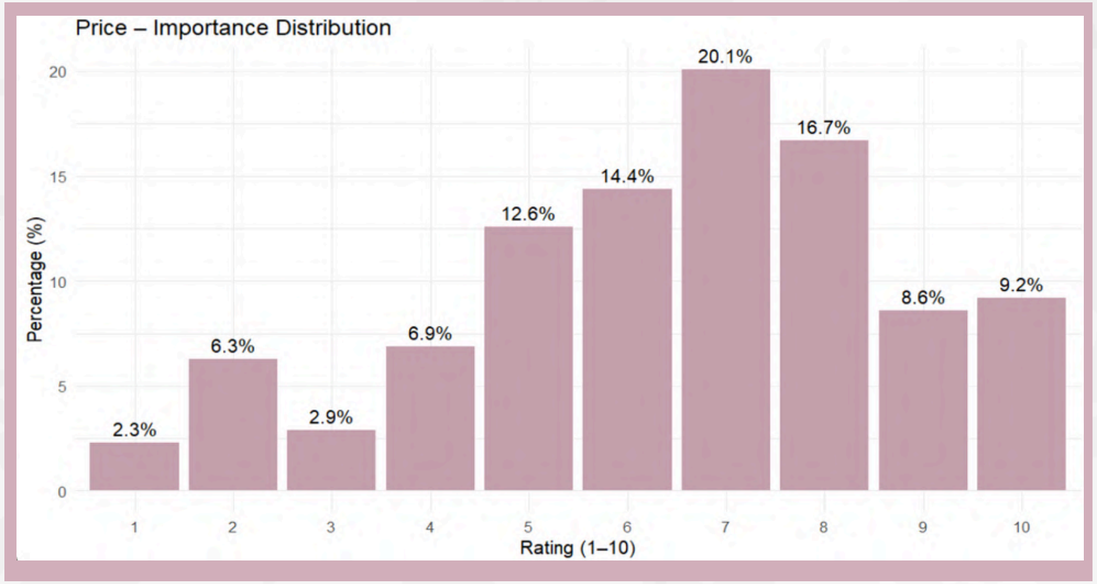

Longevity ranks second (mean = 7.61, median = 8), with a **more distributed response curve**: while **29.9% assigned the maximum score,** other ratings (especially between 6 and 9) are also significantly represented. This suggests that longevity is important, but interpreted more flexibly, possibly depending on context of use or consumer profile.

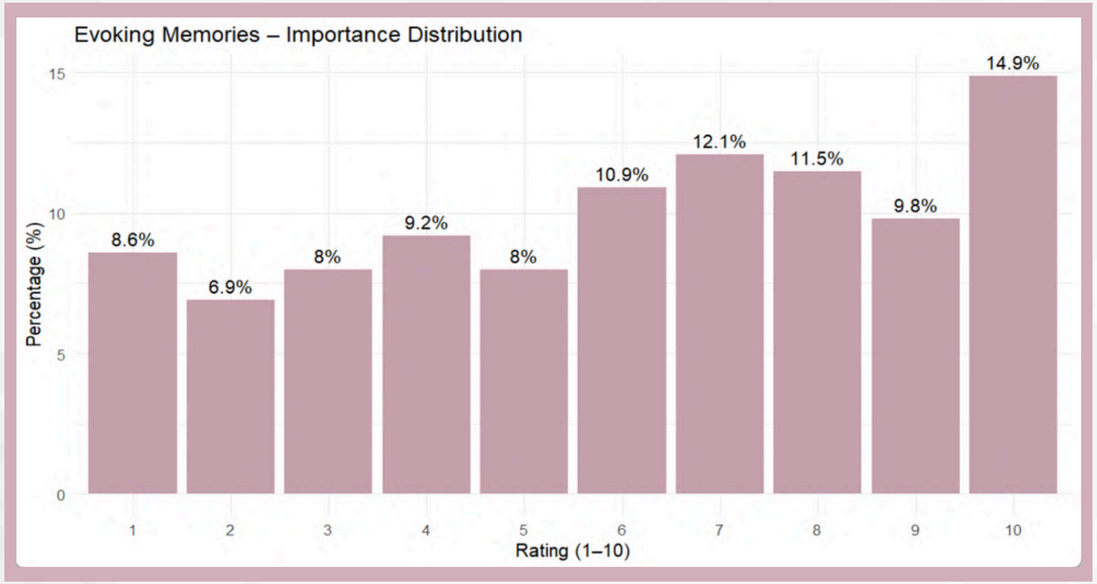

The gap between these top two drivers and the remaining factors, such as price, evoking memories, or sustainability, is substantial. This provides useful insight for product development, confirming that fragrance character and lasting power remain the pillars of consumer expectations in the perfume market.

DRIVERS OF CHOICE

Factor	Mean	Median	SD
Fragrance notes	8.98	10	1.46
Longevity	7.61	8	2.43
Price	6.44	7	2.28
Evoking memories	6.03	6	2.89
Seasonality	5.52	6	2.85
Brand reputation	4.70	5	2.48
Sustainability	4.68	4	2.90
Personalization	4.64	5	2.95
Packaging	4.13	4	2.27
Unisex option	3.03	2	2.50

Other factors that stand out in a positive way are" Price" and "Evoking Memories", reporting a mean respectively of 6.44 and 6.03.

For **Price**, although the **mean score is relatively high (6.44),** the responses are **widely spread**, with a peak at 7 (20.1%), but significant values across the entire scale. Only 9.2% rated it with a 10, indicating that while economic considerations are relevant, they are not the primary concern for most consumers.

Similarly, **Evoking Memories** shows a growing curve that peaks at 10 (14.9%), but maintains consistent values between 5 and 9. The **emotional dimension** of perfume use appears to be **meaningful**, but **more personal and variable** across respondents. This results in a median relevance (mean = 6.03) but with a less defined consensus compared to more functional drivers like longevity.

Relating to this factors we observe distributions that are more fragmented and nuanced compared to the top two drivers. Both of them lack the unanimous importance seen in olfactory character and durability, but still emerge as key secondary dimensions.

HABITS CONCLUSIONS

- For what concerns consumer habits we can conclude that according to **frequency of usage**, perfume has become an integral part of respondents' daily routines. With **over 80% using it multiple times a week** and more than half applying it every day, fragrance is no longer perceived solely as a luxury reserved for special moments. Moreover, the fact that nearly **90% wear it in everyday contexts, such as work, university, or regular social events**, confirms that perfume is now valued for its role in personal identity and self-care. For brands like Dior, this shift highlights the importance of promoting products not only for elegance and exclusivity, but also for their everyday usability and emotional comfort.

- Consistently with this idea, **medium and large formats** of perfumes turned out to be among the most preferred. Respondents prioritize **longevity** and value for money of the biggest size, represented by **100ml (48.9%)**, as well as the practicality of a size that fits into everyday life without being bulky **50ml(48.3%)**, suggesting that most consumers are looking for **convenience** rather than indulgence. For Dior, this insight reinforces the importance of offering larger sizes in their core lines and optimizing packaging for durability and practicality. While compact formats appeal to a niche (only 6.9%), and **smaller sizes** may serve more **occasional or travel-specific needs**, the brand could benefit more from pushing **refillable or long-use formats** that match customer expectations for both value and convenience.

- To complement the findings we also explored which **fragrance notes** are most appreciated. Interestingly, the data shows **no dominant olfactory preference**: citrusy (39.7%), floral (39.1%), woody (36.2%), and spicy (33.3%) scents are all **nearly equally appreciated**, with sweet/vanilla following at 29.3%. This uniformity suggests that consumers are open to a variety of scent profiles, without a strong bias toward one family. This presents a strategic **opportunity to diversify** olfactory offerings across multiple lines, rather than relying on a single "hero" scent profile. **Segmenting preferences** by gender, age, or frequency of use could further help Dior tailor specific launches to better suit niche audiences while maintaining broad appeal.

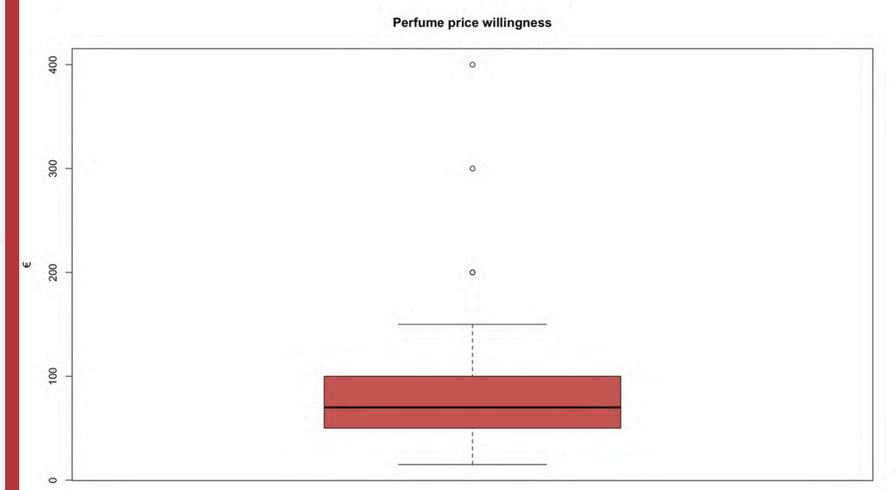

- The analysis of **drivers of choices** reveals a clear hierarchy in the factors influencing luxury perfume choice. **Fragrance Notes** emerge as the **top driver (mean = 8.98; median = 10),** with over 51% of respondents rating them as "very important". **Longevity** follows **(mean = 7.61; median = 8),** though responses are more distributed, reflecting different expectations depending on usage habits. A **second tier of importance** includes **Price (mean = 6.44) and Evoking Memories (mean = 6.03)**, both showing more fragmented distributions, suggesting that while these dimensions matter, they vary significantly by consumer profile. Further down the scale, Seasonality (5.52), Brand Reputation (4.70), Sustainability (4.68), and Personalization (4.64) show moderate to low relevance, while Packaging (4.13) and especially Unisex Option (3.03) are perceived as the least important.

3. HOW MUCH ARE CONSUMERS WILLING TO PAY FOR A PREMIUM FRAGRANCE AND THEIR PRICE PERCEPTION?

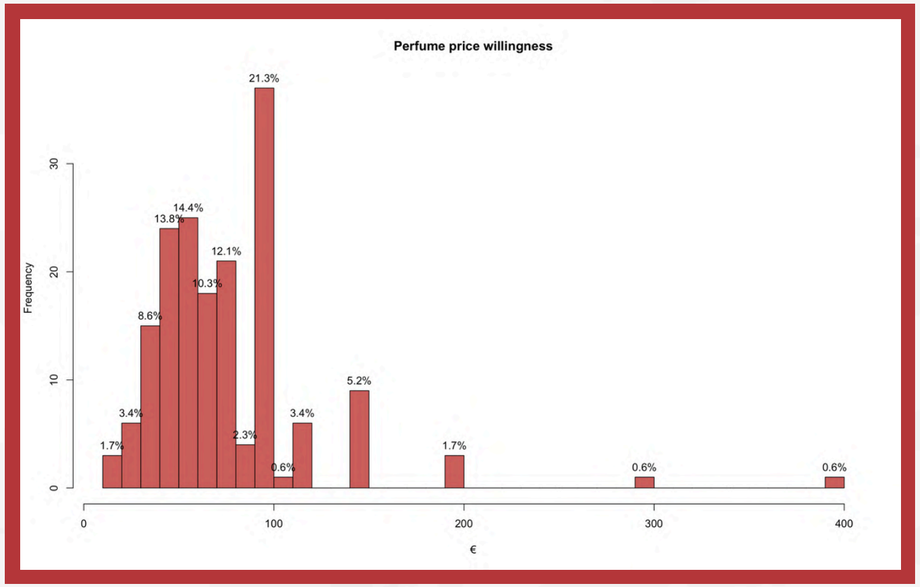

3.1 UNIVARIATE ANALYSIS OF WILLIGNESS TO PAY
3.2 WILLIGNESS TO PAY ACCORDING TO DRIVERS OF CHOICE
3.3 PERCEPTION OF A LUXURY PERFUME
3.4 WILLIGNESS TO PAY ACCORDING TO PERCEPTION OF LUXURY IN PERFUMES
3.5 WILLINGNESS TO PAY FOR PERFUME ATTRIBUTES
3.6 WILLIGNESS TO PAY ACCORDING TO BRAND LOYALTY AND TO DIOR LOYALTY
3.7 PARTIAL CONCLUSIONS

WILLIGNESS TO PAY

The analysis of consumers' willingness to pay for a perfume reveals a distribution heavily concentrated in the **mid-to-low price range**, with a gradual decline in frequency as prices increase. Approximately **88%** of respondents are willing to spend **less or equal to €100**, indicating a general price sensitivity and a preference for more affordable or mid-range products.
The **€40–€70** range stands out in particular, accounting for nearly **40%** of all responses. This suggests it represents a highly competitive price bracket and is likely perceived as a fair price for a standard-quality perfume.

The most frequently selected price range is **between €90 and €100**, chosen by **21.3%** of respondents. This indicates a psychological price ceiling for many consumers. Beyond this point, willingness to pay drops sharply, with very few respondents selecting prices above €120.

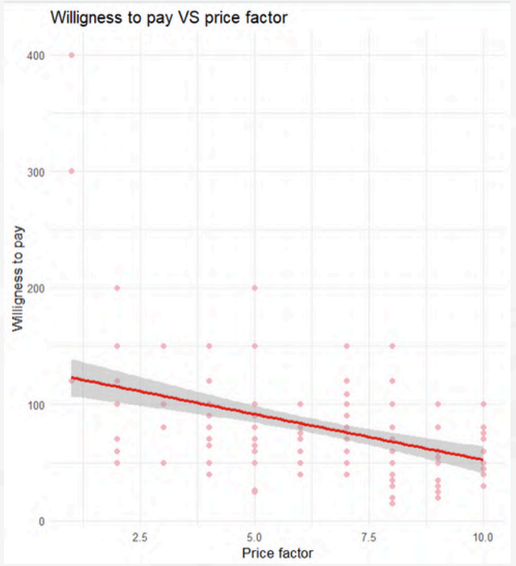

Class	Cumulative percent
0-50€	27,58%
50-100€	87,93%
100-150€	97,13%
more than 150€	100%

Looking at the cumulative percentages, over **97%** of consumers are **not willing to spend more than €150,** and fewer than **3%** are willing to pay **between €150 and €400**. These values point to the presence of a small premium segment, likely composed of individuals seeking luxury, exclusive, or niche products. Based on the data, Dior should **focus on strengthening its presence in the 60–100€ price range**, where the majority of consumers are willing to spend. This segment represents a strong opportunity to maintain volume while reinforcing the brand's luxury image.

DRIVERS OF CHOICE AND WILLIGNESS TO PAY

We are testing the relationships between **drivers of choice** and **willigness to pay**: is there a linear relation between these two factors?
Since the two variables are **quantitative** (willigness to pay and points assigned to that factor) we are checking their correlation using the **t test** designed to assess the hypothesis of linear independence between two variables, by using the **linear correlation index ρ.** With this test we check:
H0: linear correlation index= 0 against H1: linear correlation index ≠ 0.
We did the t-test on every factor and only two of them appeared to have a significant linear relation with the willigness to pay variable being the only ones to have a p-value < 0.05 and a linear correlation index meaningfully different from zero.

PRICE

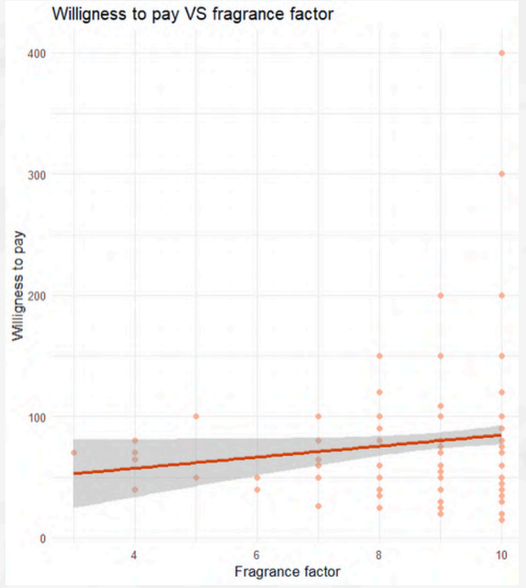

```
        Pearson's product-moment correlation

data:  Dior$Q11_1 and Dior$Q33
t = -5.6777, df = 172, p-value = 5.703e-08
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 -0.5155833 -0.2641278
sample estimates:
       cor
-0.3972866
```

The analysis reveals a **moderate negative correlation** between the importance assigned to price and the willingness to pay for a perfume.
The **correlation coefficient is −0.397**, with a p-value of 5.703e−08, indicating that the relationship is **statistically significant**. Also the confidence interval, confirms the robustness of the negative association.
In practical terms, those who consider price a highly importance factor (values close to 10) tend to be less willing to spend higher, while those who care less about price are more open to paying more.
From a **business perspective**, this suggests that price-sensitive customers respond better to accessible pricing and discounts. On the other hand, customers less driven by price may be more receptive to premium formats, storytelling, or exclusive packaging, where perceived value plays a bigger role than cost.

FRAGRANCE NOTES

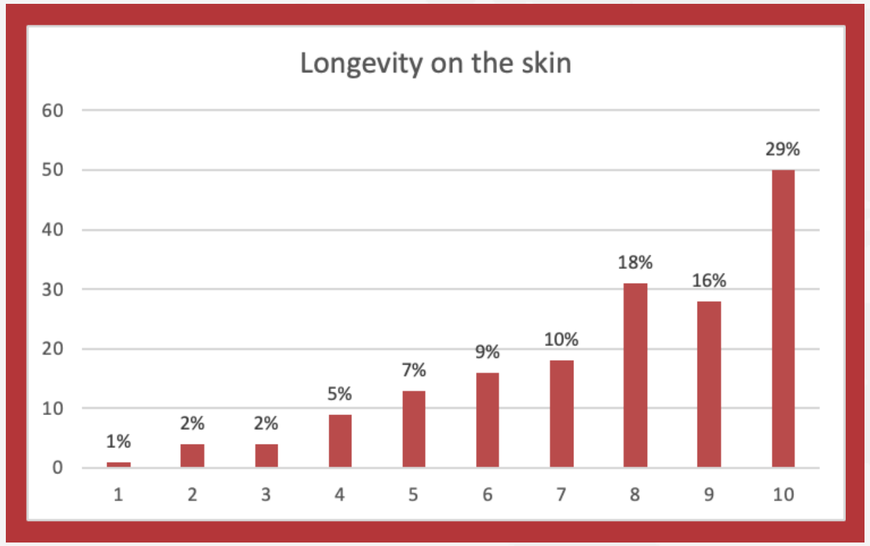

```
        Pearson's product-moment correlation

data:  Dior$Q11_3 and Dior$Q33
t = 1.9653, df = 172, p-value = 0.05099
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 -0.0005827354  0.2905635303
sample estimates:
      cor
0.1481999
```

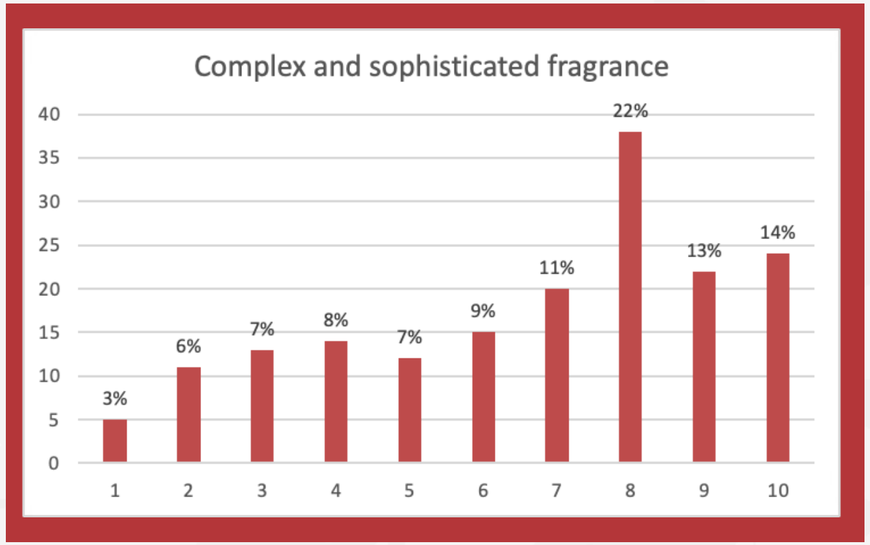

The analysis shows a **very weak positive correlation** between the importance given to fragrance and the willingness to pay.
The **correlation coefficient is 0.148** with a p-value of 0.05099. Since this value exceeds the standard significance threshold of 0.05, the relationship is **not statistically significant.**
Although the result is close to significance, it does not meet the required criteria, and the confidence interval includes zero. Therefore, the evidence is not sufficient to confirm a meaningful relationship.
The weak positive trend suggests that, as consumers perceive fragrance notes as more important, they may be slightly more willing to pay, but the effect is modest and inconclusive.
From a **business point of view**, this implies that while fragrance is a key part of the product experience, it does not on its own justify a premium price — unless reinforced by other elements such as brand image, packaging, or exclusivity.

PERCEPTION OF A LUXURY PERFUME

The average score for how much **longevity on the skin** influences the perception of a luxury perfume was **7.72**, with a median of **8** and a standard deviation of **2.22**. This indicates that, overall, participants consider this feature quite important, though some variation in opinion exists.nLooking at the distribution, **63%** of respondents rated it 8 or higher, showing that the majority strongly associate long-lasting scents with luxury. In particular, **29%** gave it a full score of 10, emphasizing its value. On the other hand, only **17%** gave it a score of 5 or below, suggesting that while longevity is not the top priority for everyone, it is broadly recognized as a key quality of premium fragrances. In terms of willingness to pay, this characteristic could **justify a higher price**, as it reflects lasting quality and performance.

	mean	median	sd
Complex and sophisticated fragrance	6.63	7	2.60
Exclusive availability in boutiques	4.57	4	2.99
High price compared to other perfumes	5.20	5	3.00
Longevity on the skin	7.72	8	2.22
Niche or lesser-known brand	5.49	5	2.79
Complex and refined packaging	5.02	5	2.73

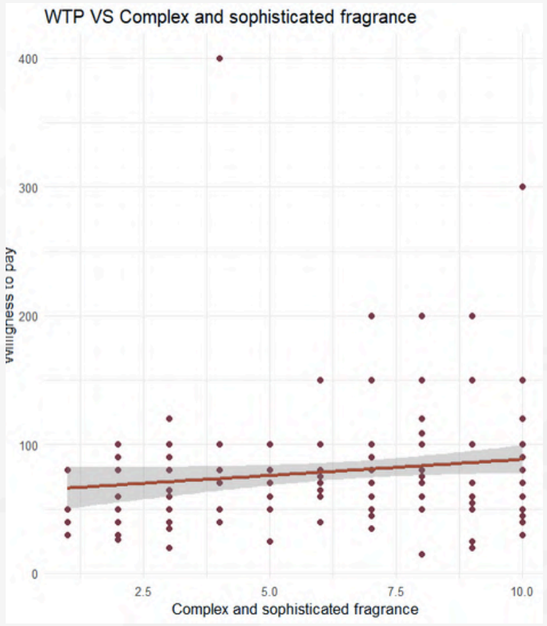

The average score for how much a **complex and sophisticated fragrance** influences the perception of a luxury perfume was **6.63**, with a median of **7** and a standard deviation of **2.60**. This indicates that the feature is considered moderately important, but with a wide range of opinions among respondents. Looking at the distribution, about **49%** of participants rated it 8 or higher, showing that many people do associate fragrance complexity with luxury. However, nearly a quarter of the sample (**24%**) gave it a score of 4 or lower, suggesting that for a significant group, this characteristic is not central to defining a perfume as luxurious. So, a sophisticated perfume **might justify a higher price** for some consumers, but it is not the strongest pricing driveroverall.

LUXURY FACTORS AND WILLIGNESS TO PAY

We previously identified which factors most influence the perception of luxury according to our respondents. Now, we can evaluate through a bivariate analysis whether people who consider these factors as indicators of luxury are also willing to pay more for a perfume. Since we are again comparing willingness to pay with a rating variable, we will use another t-test.
We did the t-test on every factor and only two of them appeared to have a significant linear relation with the willigness to pay variable being the only ones to have a p-value < 0.05 and a linear correlation index meaningfully different from zero.

COMPLEX/SOPHISTICATED FRAGRANCE

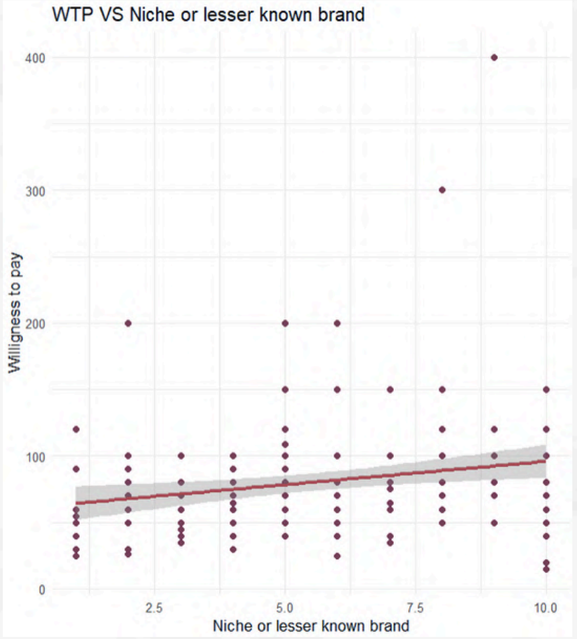

```
        Pearson's product-moment correlation

data:  Dior$Q31_1 and Dior$Q33
t = 1.9071, df = 172, p-value = 0.05818
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 -0.004978365  0.286533853
sample estimates:
      cor
0.143898
```

The scatterplot with linear fit reveals a not very strong positive relationship between how much respondents associate a “complex and sophisticated fragrance” with luxury and their willingness to pay for a perfume. The **Pearson correlation coefficient is 0.144**, indicating a weak correlation, and the **p-value is 0.058,** slightly above the conventional **95% confidence threshold**, but statistically **significant at the 90% level**. This partial significance is also reflected in the **confidence interval**, which narrowly includes zero, suggesting some uncertainty around the effect. While the correlation is weak, a slight **upward trend** can still be observed. For Dior, this suggests that although fragrance complexity is appreciated by many consumers, **it does not represent a major driver of higher spending in general**. This trend might be worth investigating further, possibly by segmenting the audience based on demographic characteristics to identify groups where the factor plays a stronger role.

NICHE OR LESSER KNOWN BRAND

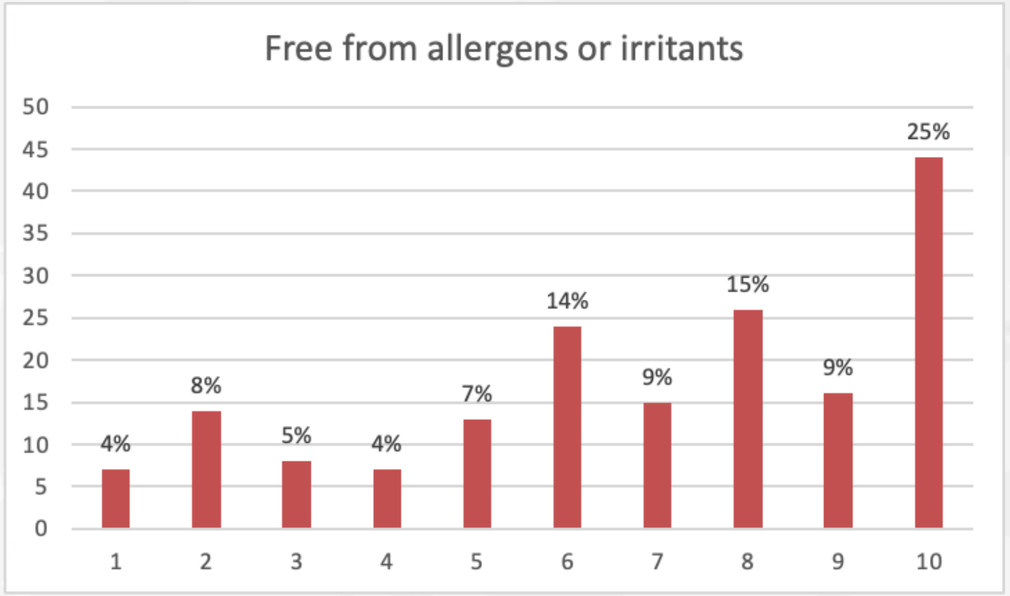

```
        Pearson's product-moment correlation

data:  Dior$Q31_5 and Dior$Q33
t = 2.92, df = 172, p-value = 0.003969
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 0.07084698 0.35463030
sample estimates:
      cor
0.2173262
```

The scatterplot with linear fit shows a **positive relationship** between how much respondents associate “niche or lesser-known brands” with luxury and their willingness to pay for a perfume. The Pearson correlation coefficient is **0.217**, indicating a **small to moderate correlation**, and the result is statistically significant **(p-value = 0.009**). The 95% confidence interval ranges from 0.07 to 0.35, clearly excluding zero, which confirms the robustness of the result.
This suggests that consumers who associate exclusivity or uniqueness, through lesser-known brands, with luxury tend to be more willing to spend on fragrances. For Dior, this insight could support **strategic moves** such as launching l**imited editions**, cultivating **artisanal sub-lines**, or emphasizing exclusivity in brand storytelling to attract premium-oriented segments.

WILLINGNESS TO PAY FOR PERFUME ATTRIBUTES

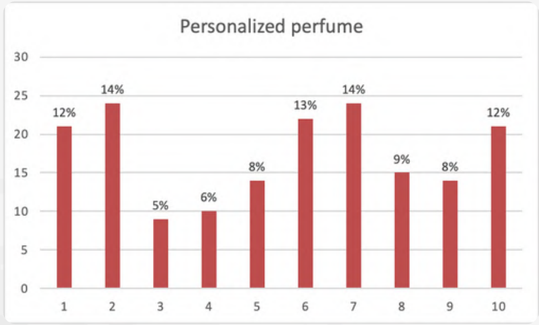

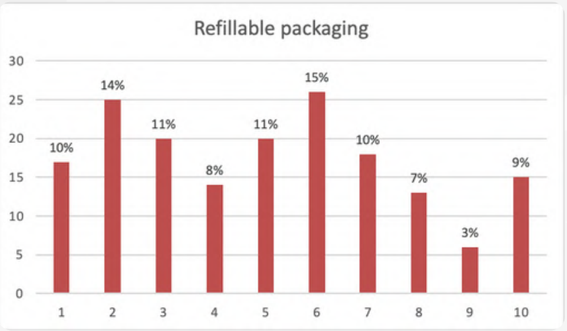

The average willingness to pay more for a **perfume free from allergens or irritants** was **6.86**, with a median of **7** and a standard deviation of **2.79**. This suggests a moderate to strong interest, though opinions vary across the sample.

	mean	median	sd
Luxury perfume	5.14	5	2.81
Refillable packaging	5.02	5	2.72
Cruelty-free and vegan ingredients	4.95	5	2.91
Free from allergens or irritants	6.86	7	2.79
Personalized perfume	5.53	6	2.99
Genderless perfume	3.14	2	2.31

Looking at the distribution, **49%** of respondents rated their willingness at 8 or above, showing that many value skin-friendly formulations. However, about **17%** rated it 3 or below, indicating that a portion of consumers does not prioritize this attribute when considering price. this feature can justify a higher price for a substantial portion of the market, particularly among **consumers prioritizing wellness and transparency**.

When looking at the other attributeshe results show a generally moderate willingness to pay more, with both the average and median scores around 5.
In particular, personalized perfume shows very mixed reactions: while 29% of respondents are willing to pay more, 31% are not interested at all, highlighting a clear division in preferences. For refillable packaging and luxury branding, the percentage of people highly willing to pay more stays below 30%, and a significant portion gave low scores.
This suggests that although these emerging trends are gaining visibility, they are not yet strong motivators for higher spending. More traditional factors, such as skin safety or fragrance longevity, still have greater influence on how people perceive value in a luxury perfume.

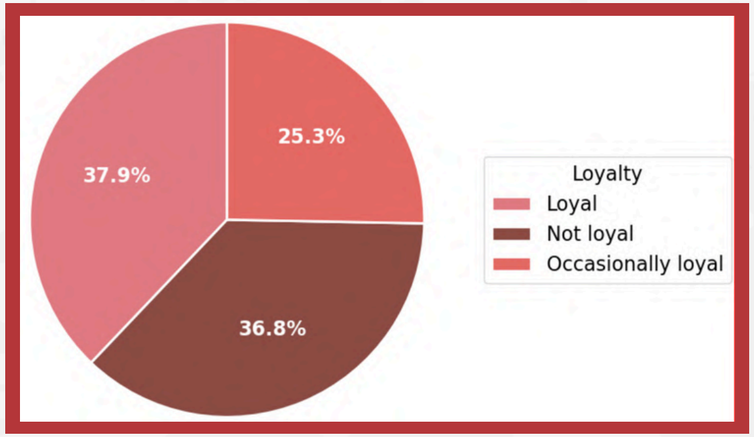

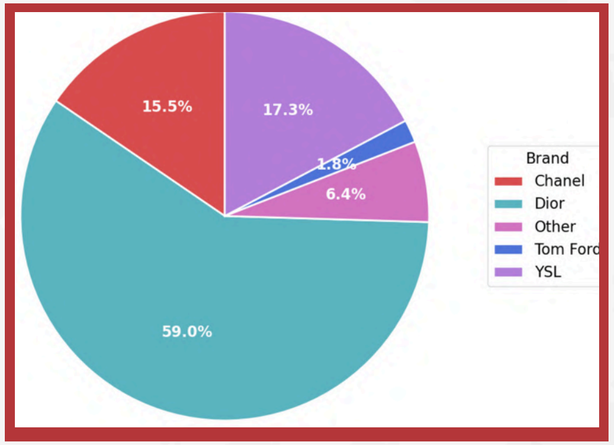

BRAND LOYALTY

To explore consumer loyalty in the fragrance market, we analyzed responses to question 18 asking if responders were **loyal to a specific brand perfume** with options: Yes, No, or It depends on the period. This allowed us to classify respondents as loyal, not loyal, or occasionally loyal.
The data reveals that only **36.8%** of respondents are truly **loyal** to a perfume brand, while a slightly higher **37.9%** declare **no brand loyalty at all**. Additionally, **25.3% are occasionally loyal**, switching depending on the period or context. So brand loyalty in the fragrance market appears fragile, for Dior, this highlights the importance of reinforcing emotional connection and distinctiveness to retain loyal customers while strategically converting the flexible and non-loyal segments.

After excluding respondents who declared no loyalty to any perfume brand, we analyzed **which brands are preferred by those who are loyal,** even occasionally through question 19. The results are represented in the pie chart on the left. This data shows that while **Dior is the most chosen among the predefined brand options**, a majority of loyal users **(59.1%) prefer other brands**. This highlights a **high degree of brand fragmentation** in the fragrance market and suggests **strong competition** from indirect competitors. This insight is valuable because it reveals that brand loyalty exists, but is widely dispersed. For Dior, this indicates the **importance of standing out** not only against major competitors like Chanel or YSL, but also against a long tail of alternative brands that consumers perceive as unique or high-quality.

Respondents who selected the "Other" option were asked to specify the brand. Among the most frequently mentioned there were **Armani, Versace, Calvin Klein**, and other luxury labels. A frequency table of these open responses is reported below, showing the brands mentioned by more than one respondent and grouping the rest under the label **“Minor categories”**. This table shows that approximately 53.6% of those who selected “Other” and **34.6% of all respondents who declared brand loyalty named a brand that was different from any brand mentioned by other participants**. This confirms a deep level of market fragmentation, driven by diverse brand preferences.

Brand	Percent within "others"	Percent within loyal
Armani	13.8%	7.3%
Versace	8.6%	4.5%
Calvin Klein	5.2%	2.7%
Prada	5.2%	2.7%
Burberry	3.4%	1.8%
Cavalli	3.4%	1.8%
Hermes	3.4%	1.8%
Victoria Secret	3.4%	1.8%
Minor categories	53.6%	34.6%
Total	**100%**	**59%**

WILLIGNESS TO PAY AND BRAND LOYALTY

In this section, we aim to investigate whether **loyalty to a perfume** brand has a measurable effect on consumers' **willingness to pay** (WTP) for a fragrance. To explore this, since WTP is quantitative and brand loyalty is qualitative, we used an **ANOVA test** (Analysis of Variance), a statistical method that compares the means of the continuous variable across two or more groups, in our case, respondents who are or are not loyal to a perfume brand.

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Q18	1	5719	5719	2.51	0.116
Residuals	128	291612	2278		

The **p-value of 0.116** indicates that the difference in average WTP between the two groups is not statistically significant at every level. So **we fail to reject the null hypothesis**. In other words, there is **no strong evidence that loyalty to a perfume brand alone leads consumers to spend more**.
Although it might be assumed that loyal consumers are more willing to spend on their preferred brand, this analysis shows no strong evidence supporting that assumption. Loyalty may reflect in repeat purchases or brand attachment, but not necessarily in higher price tolerance.

WILLIGNESS TO PAY AND DIOR LOYALTY

- **H_0 (Null Hypothesis):** There is no difference in the average WTP between loyal and non-loyal to Dior consumers.
- **H_1 (Alternative Hypothesis)**: There is a difference in the average WTP between the two groups.

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Q19_2	1	2391	2391	1.18	0.279
Residuals	172	348659	2027		

In particular, we conducted an analysis using Q19 (“Which brand are you loyal to?”) for the **respondents that selected Dior** in order to assess whether being loyal to the Dior brand increases a respondent’s willingness to pay (WTP) compared to those who are not. However, the results again were **not statistically significant (p-value=0.279)**, indicating that, on average, even Dior-loyal customers are not willing to pay more than customers loyal to other brands or not loyal to brands in general.

LUXURY CONCLUSIONS

- In this paragraph we wanted to analyse willigness to pay of responders and highlight which are the factors that are important according to them and that create value so, for these factors, people are willign to spend a higher amoount of money.

- We started analysing the variable **Willigness to pay** in general reporting how much are consumers willigness to pay for a parfume. The distribution shows a clear concentration (**61%** of respondents) **between €50 and €100**, with €100 emerging as a common ceiling. Only a small minority exceed this range and 27,9% of respondents chose a value lower that 50€. This confirms a strong price sensitivity among consumers, with the majority unwilling to spend more than €100 for a fragrance.

- In addition, when analyzing the **relationship between WTP and the drivers of choice** price and fragrance notes showed a statistically significant correlation. The correlation with **Price** was **moderately negative** (**r = –0.397**), indicating that consumers who care a lot about price tend to pay less. Conversely, the correlation with **fragrance** importance was **weakly positive** (**r = 0.148**), suggesting that while fragrance character matters, it only slightly increases consumers' willingness to pay. Other factors, including longevity, evoking memory, and seasonality, which were rated as important drivers of choice, did not prove to be significant, along with others such as brand reputation, sustainability, personalization, packaging, and unisex options, which had already been rated as less important in the choice of a perfume.

- To analyse other key aspects, we conducted a univariate analysis on the **factors that respondents associate with the concept of luxury**. The results showed that **complex/sophisticated fragrance** and **longevity on the skin** are strongly linked to the perception of luxury, confirming findings from the previous "drivers of choice" analysis, where these factors already stood out as highly important. Additionally, **niche or lesser-known brands** also emerged as indicators of luxury. Conversely, other elements such as price and packaging did not show a strong connection to the idea of luxury. We then examined the relationship between these **luxury indicators and willingness to pay**. The analysis revealed that for individuals who selected **complex and sophisticated fragrances**, the WTP is slightly higher, with a weak but significant correlation **(r = 0.144)**. Similarly, those who perceive **niche or lesser-known brands** as luxury indicators show a stronger correlation with WTP **(r = 0.217)**. This suggests that exclusivity plays a clearer and more measurable role in justifying higher price points.

- Other factors analysed included Luxury Perfume, Refillable Packaging, Cruelty-Free and Vegan Ingredients, Free from Allergens or Irritants, Personalized Perfume, and Genderless Perfume. Respondents were asked to rate their willingness to pay more for each of these **trending elements**. The results show that the **strongest price drivers are "Free from allergens or irritants" (highest mean score: 6.86)**, followed by **Personalized Perfume (mean = 5.53)** and **Luxury Positioning (mean = 5.14)**. These suggest a growing demand for safety and individualization in fragrance offerings. In contrast, Refillable Packaging (5.02) and Cruelty-Free/Vegan Ingredients (4.95) appear to have a weaker influence on price tolerance. While these factors align with sustainability and ethical values, they may now be perceived as baseline expectations rather than premium features. Finally, Genderless Perfumes received the lowest score (3.14), indicating that gender neutrality remains a niche appeal, not yet a widespread commercial driver for most consumers.

- Finally, a last analysis shows that **brand loyalty does not significantly impact willingness to pay (WTP).** We first conducted an ANOVA test comparing the WTP of respondents who declared being loyal to a brand (% = [INSERT NUMBER AFTER UNIVARIATE ANALYSIS]) with those who did not. The **p-value of 0.116** indicates that there is no statistically significant difference in WTP between loyal and non-loyal consumers. A second analysis focused specifically on respondents who stated they were **loyal to Dior** ([INSERT %] of the sample). Here too, the p-value of **0.279** confirmed that even loyalty to a luxury brand does not lead to a higher willingness to pay. In practical terms, while brand loyalty may reflect repeated purchasing behaviour or preference, it does not automatically translate into greater price tolerance. For brands, this implies that customer retention alone is not enough to justify higher prices, perceived value and product characteristics remain the key drivers of premium pricing.

4. WHAT ARE THE MAIN PREFERENCES AND ATTITUDES REGARDING FRAGRANCE PURCHASES?

4.1 TYPE OF FORMAT
4.2 PREFERRED PURCHASE PLACE
4.3 ONLINE SHOPPING EXPERIENCE
4.4 KEY FACTORS IN ONLINE SHOPPING COMPARED BY PURCHASE PREFERENCE
4.5 IN STORE SHOPPING EXPERIENCE
4.6 KEY FACTORS IN IN-STORE SHOPPING COMPARED BY PURCHASE PREFERENCE
4.7 FRAGRANCE PURCHASES PREFERENCES AND ATTITUDES CONCLUSION

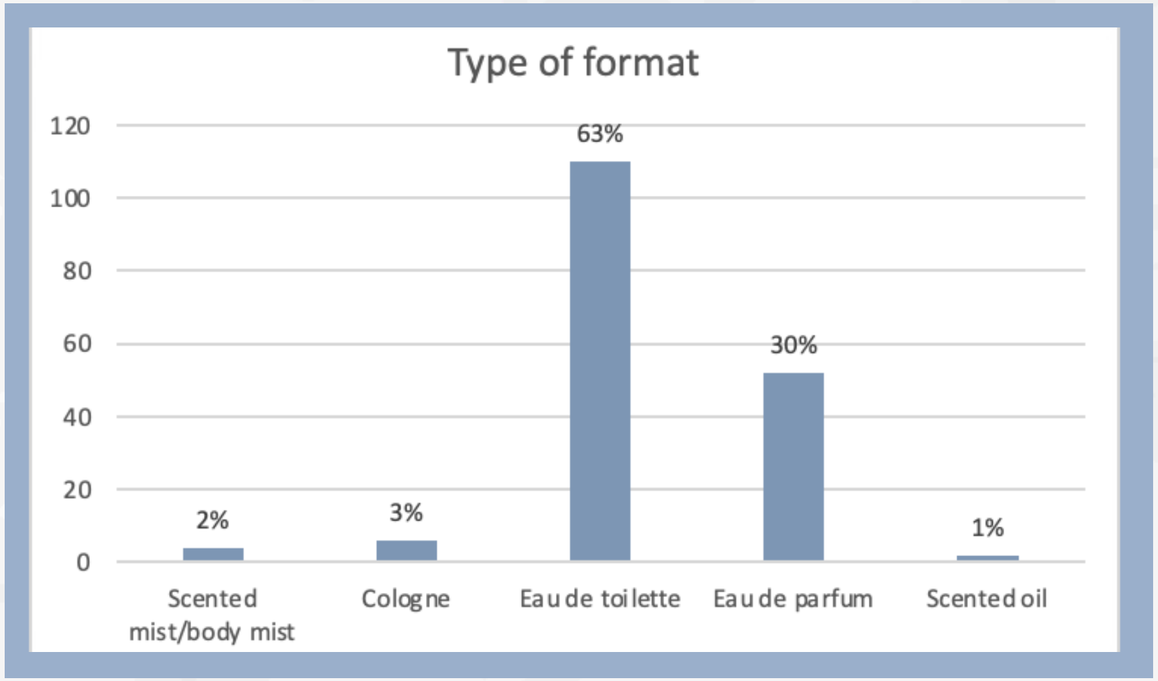

TYPE OF FORMAT

The data collected regarding the preferred fragrance formats among our sample reveals a clear dominance of two main types. Specifically, **63%** of respondents (110 individuals) indicated that they prefer Eau de Toilette, while **30%** favor Eau de Parfum (52 individuals). Together, these two formats account for a substantial **93%** of the total sample, highlighting their overwhelming popularity compared to other options.

The remaining **7%** of the sample shows a much lower preference for other fragrance formats: 2% prefer scented/body mists, 3% choose colognes, and only 1% opt for scented oils. This small proportion suggests that these alternative formats play a minor role in the purchasing habits of the sample.

Type of format	Cumulative percentage
Eau de toilette	63%
Eau de parfum	93%
Cologne	96%
Scented mist/body mist	98%
Scented oil	100%

Eau de Toilette and Eau de Parfum clearly dominate the market preferences within this sample, likely due to their balance of fragrance intensity, longevity, and price point.

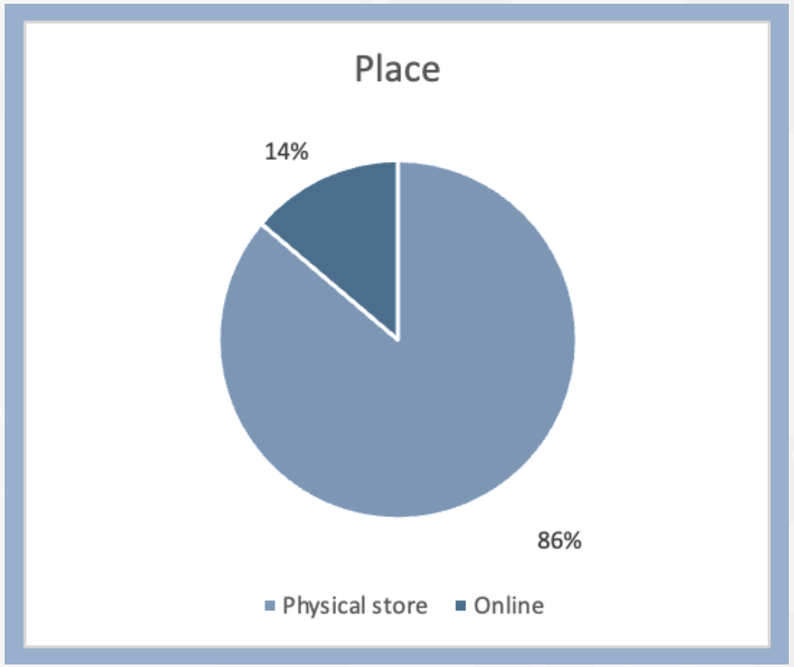

The minimal interest in scented/body mists, colognes, and scented oils indicates that these formats cater to niche segments or are less aligned with the current consumer needs in this sample.

For brands and marketers, focusing on **Eau de Toilette and Eau de Parfum formats appears to be the most effective strategy** to meet the preferences of the majority of consumers in this group.

PREFERRED PURCHASE PLACE

The data gathered from the sample highlights a strong preference for physical retail when it comes to purchasing luxury perfumes. **86%** of respondents (150 individuals) stated that they prefer to buy luxury fragrances in a physical store, while only **14%** (24 individuals) reported a preference for online shopping.

This behavior may be driven by the sensory experience offered by physical stores, which allows customers to test scents directly—an essential factor when choosing high-end products.

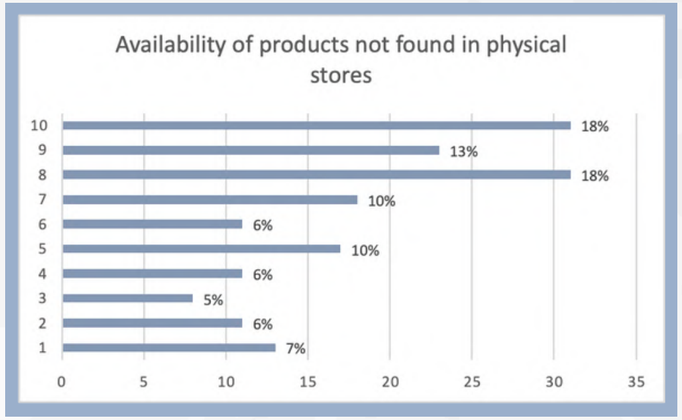

The relatively low adoption of online shopping (14%) suggests that, despite the rise of e-commerce, digital platforms still face limitations when it comes to luxury fragrance sales. Concerns about product authenticity, the inability to test scents, and the experiential nature of luxury purchases may be key barriers.

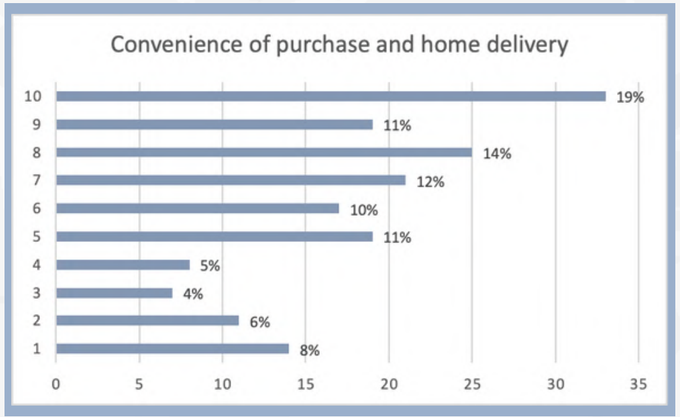

From a behavioral perspective, this finding underscores that physical presence and direct engagement remain crucial in the luxury fragrance segment, which has implications for brand strategy and retail investment.

ONLINE SHOPPING EXPERIENCE

	mean	median	sd
Better price or exclusive discount	7.48	8	2.56
Availability of products not found in physical store	6.58	7	2.87
Convenience of purchase and home delivery	6.52	7	2.86
Inability to visit a physical store	5.17	5	2.90
Ability to compare products and reviews	5.48	6	2.72

The average score for the **<u>importance of price or exclusive discounts</u>** among online buyers is **7.48**, with a median of **8** and a standard deviation of **2.56**. This suggests that price is considered quite important, with moderate variation in opinions. Looking at the distribution, the majority of responses were clustered in the high range: **60%** of respondents gave a score of 8 or higher, indicating a strong sensitivity to pricing advantages. Only a small portion (13%) gave low scores (1–4), showing that very few online buyers disregard price as a factor. The results suggest that price sensitivity is a **key driver** for those who choose to purchase luxury perfumes online. Online buyers may be more motivated by **deals, discounts, or perceived value**, rather than brand experience or exclusivity alone. From a strategic standpoint, this indicates that online marketing should **emphasize pricing advantages**, such as time-limited promotions, loyalty rewards, or exclusive online bundles.

The average score for the **<u>importance of accessing products not available in physical stores</u>** is **6.58**, with a median of **7** and a standard deviation of **2.87**, indicating moderate importance and greater variability in responses. In terms of distribution the **49%** of respondents rated it 8 or higher, showing that a big portion of online buyers values product exclusivity. However, lower ratings were also common, with **28%** giving scores between 1 and 5, suggesting that this factor is not a key motivation for all online shoppers. The variation in responses indicates that online shoppers are not a homogeneous group (some are motivated by uniqueness, while others prioritize different factors)

The average score for the **<u>importance of convenience and home delivery</u>** is **6.52**, with a median of **7** and a standard deviation of **2.86**. This indicates a moderate overall importance and a wide variation in responses. Looking at the distribution the **44%** of respondents rated it 8 or higher, showing that convenience matters to a considerable portion of online buyers. However, **39%** gave scores between 1 and 5, suggesting that for many, convenience is not the main driver when purchasing perfumes online. So The relatively balanced distribution shows that convenience of purchase and home delivery is **not a universally strong motivator** for online luxury perfume buyers. This also suggests **diverse consumer behaviors**, with some individuals prioritizing practicality and others driven more by price or product access.

KEY FACTORS IN ONLINE SHOPPING COMPARED BY PURCHASE PREFERENCE

Convenience of purchase and home delivery

	Mean	Sd
In-store	6,3	2,84
online	7,88	2,64

```
            Df Sum Sq Mean Sq F value Pr(>F)

online	6,46	3,02

```
            Df Sum Sq Mean Sq F value Pr(>F)
Q12          1   26.8  26.810    3.67 0.0571 .
Residuals  172 1256.6   7.306
```

$\eta^2 = 0.021$

Better price or exclusive discounts

	Mean	Sd
In-store	7,35	2,6
online	8,29	2,22

```
            Df Sum Sq Mean Sq F value Pr(>F)
Q12          1   18.5  18.476    2.84 0.0937 .
Residuals  172 1118.9   6.505
```

$\eta^2 = 0.016$

Availbility of products not fount in physical stores

	Mean	Sd
In-store	6,45	2,87
online	7,38	2,75

```
            Df Sum Sq Mean Sq F value Pr(>F)
Q12          1   17.6  17.575   2.155  0.144
Residuals  172 1402.8   8.156
```

$\eta^2 = 0.012$

Ability to compare productsband reviews

	Mean	Sd
In-store	5,84	2,91
online	6	2,8

```
            Df Sum Sq Mean Sq F value Pr(>F)
Q12          1   19.1  19.068   2.281  0.133
Residuals  172 1437.8   8.359
```

$\eta^2 = 0.013$

The only factor showing a statistically significant difference was **"Convenience of purchase and home delivery"**, with an F-value of **6.48**, a p-value of **0.0118**, and an eta-squared of **0.036**. This suggests that consumers who prefer to buy online value convenience considerably more than those who prefer physical stores. This aligns with the broader objective of the study, highlighting that logistical ease and time-saving benefits are key drivers in the decision to shop online for luxury perfumes.

A second factor, "**Inability to visit a physical store**", presented marginal significance with a p-value of **0.0571**, an F-value of **3.67**, and a small effect size (η^2 = **0.020**). While not conclusive, this result indicates a possible trend: some consumers may choose online shopping not solely out of preference, but due to external limitations—such as time constraints, geographical distance, or mobility issues.

Lastly, "**Better price or exclusive discounts**" showed some difference in importance between the two groups, though not statistically significant (F = **2.84**, p = **0.0937**, η^2 = **0.0162**). This may imply that while online shoppers tend to value discounts slightly more, price alone is not a strong differentiator between online and in-store buyers in the luxury perfume segment.

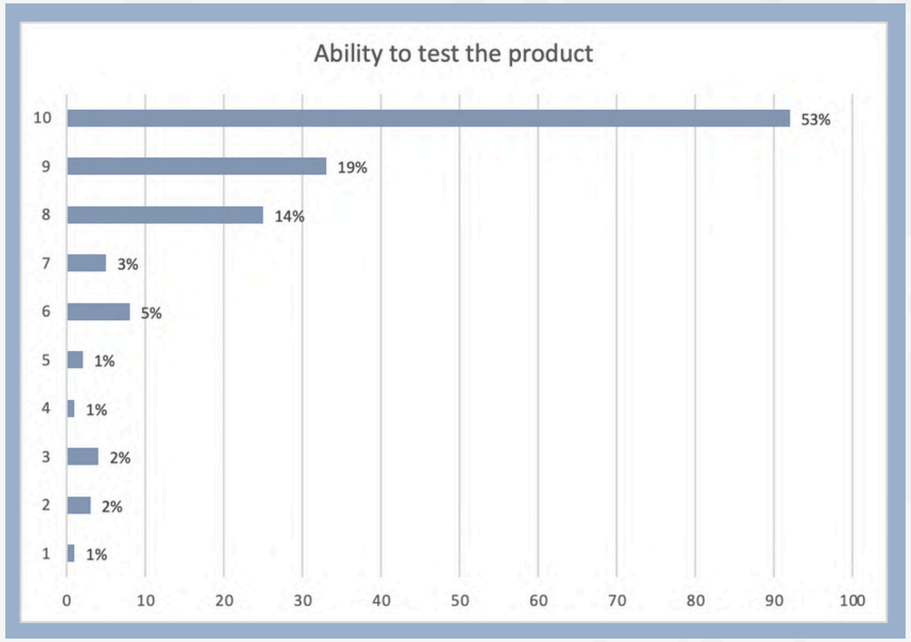

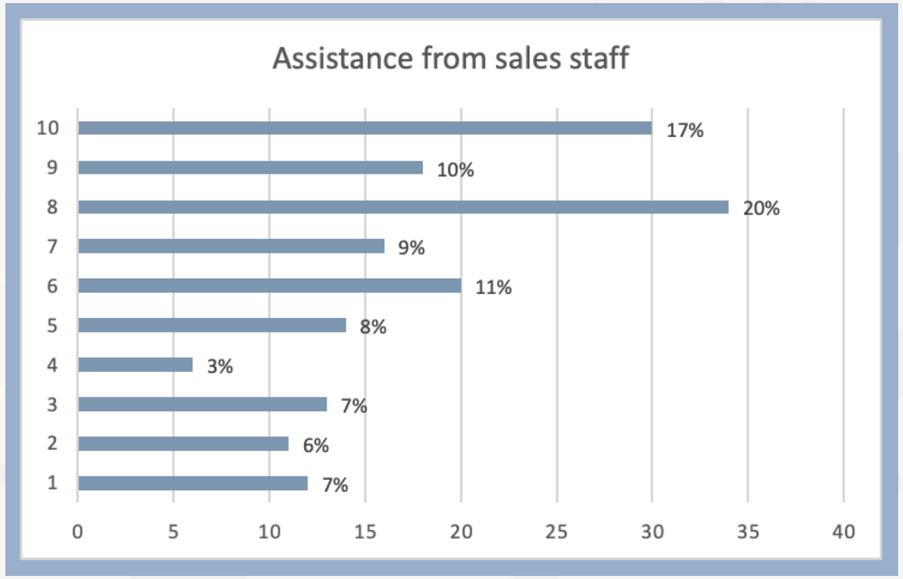

The remaining two factors, "**Availability of products not found in physical stores**" (F = **2.155**, p = **0.144**, η^2 = **0.0124**) and "**Ability to compare products and reviews**" (F = **2.281**, p = **0.133**, η^2 = **0.0013**), did not show statistically significant differences between online and in-store shoppers.

This suggests that both groups attribute similar importance to the uniqueness of online product offerings and the ability to compare reviews. Despite being commonly associated with online shopping, these features are not decisive in influencing shopping preference within the luxury perfume segment. Their low effect sizes also indicate a minimal practical impact on consumer behavior.

IN-STORE SHOPPING EXPERIENCE

	mean	median	sd
Ability to test the product	8.81	10	1.89
Assistance from sales staff	6.51	7	2.82
Store design and atmosphere	5.09	5	2.87
Location and store hours	6.19	6	2.65

The average score for the **<u>importance of testing the product before purchase</u>** was **8.81**, with a median of **10** and a standard deviation of **1.89**, indicating very high importance and low variability. In terms of distribution the **86%** of respondents rated it 8 or higher, with **53%** giving the maximum score of 10, showing that testing is a critical factor for in-store buyers.Very few respondents gave low scores, confirming that this is a shared and consistent priority among those who prefer physical stores. The results clearly show that the ability to test the product is a key motivator for in-store fragrance buyers. This reflects a strong behavioral difference compared to online shoppers. Being able to try the perfume in person reduces purchase uncertainty and may help justify a higher price or enhance satisfaction with the purchase experience.

The average score for the importance of **assistance from sales staff** was **6.51**, with a median of **7** and a standard deviation of **2.82**, indicating a moderate level of importance and notable variability in responses. Regarding the distribution the **47%** of respondents rated this factor 8 or higher, suggesting that nearly half of in-store buyers value sales assistance. Conversely, **20%** gave it a score of 3 or below, indicating that a significant minority do not consider it an important factor. This reflects behavioral diversity among in-store consumers and indicates that personal interaction is not a universal priority. The presence of knowledgeable staff may enhance value for certain customers, but it is unlikely to drive higher prices across the board.

KEY FACTORS IN IN-STORE SHOPPING COMPARED BY PURCHASE PREFERENCE

Assistance from sales staff

	Df	Sum Sq	Mean Sq	F value	Pr(>F)	
Q12	1	94.8	94.75	12.69	0.000477	***
Residuals	172	1284.7	7.47			

	Mean	Sd
In-store	6,81	2,69
online	4,67	2,99

$\eta^2 = 0.069$

Among the four in-store experience factors analyzed, only the importance of **assistance from sales staff** shows a statistically significant difference between those who prefer to buy luxury perfumes online and those who prefer to shop in physical stores (F = 12.69, p = **0.0005**, η^2 = **0.0687**). This indicates a moderate effect size, suggesting that **personal interaction with knowledgeable staff is a meaningful driver for in-store shoppers**, while it matters much less to those who favor online shopping. The result highlights how human guidance and tailored advice remain essential components of the luxury purchasing experience for offline consumers.

Ability to test the product

	Mean	Sd
In-store	8,82	1,85
online	8,75	2,13

$\eta^2 = 0.00016$

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Q12	1	0.1	0.101	0.028	0.866
Residuals	172	614.6	3.573		

Store design and atmosfere

	Mean	Sd
In-store	5,23	2,89
online	4,25	2,59

$\eta^2 = 0.014$

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Q12	1	19.7	19.735	2.423	0.121
Residuals	172	1400.8	8.144		

Location and store hours

	Mean	Sd
In-store	6,09	2,66
online	6,79	2,55

$\eta^2 = 0.0083$

	Df	Sum Sq	Mean Sq	F value	Pr(>F)
Q12	1	10.1	10.090	1.443	0.231
Residuals	172	1202.7	6.992		

For the other three in-store experience factors (ability to test the product, store design and atmosphere, and location and store hours) **no significant differences** were found between online and in-store shoppers. This indicates that these elements are perceived as similarly important regardless of shopping preference. For example, even those who primarily buy online still recognize the value of being able to test a perfume, or appreciate the ambiance and accessibility of physical stores, though these factors do not seem to drive their choice of channel. These results suggest that certain aspects of the in-store experience are universally appreciated, but they are not decisive in shaping consumer behavior when it comes to choosing between online and offline shopping.

FRAGRANCE PURCHASES PREFERENCES AND ATTITUDES CONCLUSION

- First, the analysis of **preferred fragrance formats** reveals a strong dominance of **Eau de Toilette** (63%) and **Eau de Parfum** (30%), accounting for **93%** of the sample. This highlights a clear consumer focus on formats that offer a balance between intensity, longevity, and price. For Dior, this suggests that the core product portfolio should continue to prioritize these formats, with more niche options playing a secondary, supporting role.

- When it comes to **purchase channels**, a substantial **86%** of respondents prefer to buy in **physical stores**, underscoring the enduring relevance of in-store experiences in the luxury segment. This preference is primarily driven by the **ability to test the product**, which received a very high average importance score of 8.81 and a median of 10. In-store shoppers also significantly value **assistance from sales staff** ($F = 12.69$, $p < 0.001$, $\eta^2 = 0.0687$), reinforcing the importance of personalized service. These elements point to the need for Dior to continue investing in immersive retail environments, focusing on expert consultation and product sampling to reinforce brand value and consumer satisfaction.

- On the other hand, although only **14%** of respondents prefer to buy luxury perfumes **online**, the online shopping experience reveals meaningful insights. Online buyers strongly value **convenience and home delivery**, with this factor showing a significant difference between channel preferences ($F = 6.48$, $p = 0.0118$, $\eta^2 = 0.036$). Marginal significance was also found for inability to visit a physical store ($p = 0.0571$), suggesting that online shopping may sometimes be driven by necessity rather than preference. Better prices and exclusive discounts are moderately important to online shoppers (average score: 7.48), but the channel choice does not appear to be primarily price-driven, as confirmed by the lack of significant difference in willingness to pay across purchase channels ($F = 1.216$, $p = 0.272$).

- Moreover, several online shopping features typically associated with **digital convenience**—such as access to exclusive products and comparison of reviews—did **not show significant differences between the two groups**, suggesting these factors are universally valued but not decisive in driving channel choice.

- These results suggest that Dior should continue to **invest heavily in physical retail**, ensuring that in-store experiences are rich, sensory, and service-driven. At the same time, it is crucial to **enhance the online experience**, particularly by emphasizing convenience, efficient delivery, and selective promotions. An **omnichannel strategy** that recognizes the complementary strengths of each channel—experiential richness offline and logistical ease online—will be key to meeting diverse consumer needs while maintaining brand prestige.

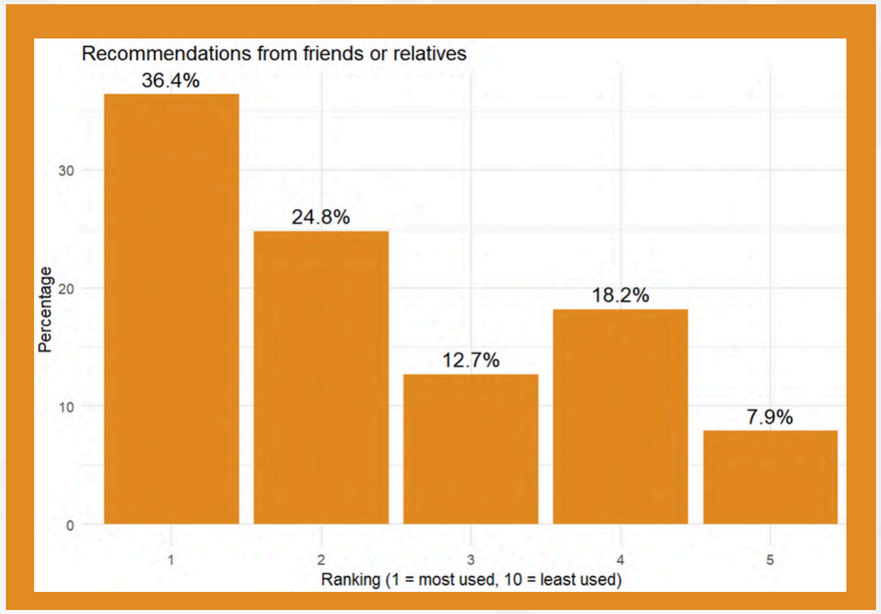

- Ultimately, consumers are **not strictly divided by price sensitivity or product access**; instead, their choices are shaped by how the **purchase experience aligns with their lifestyle and expectations**. Dior should therefore tailor its value proposition across channels, ensuring consistency in luxury perception while adapting to different usage contexts.

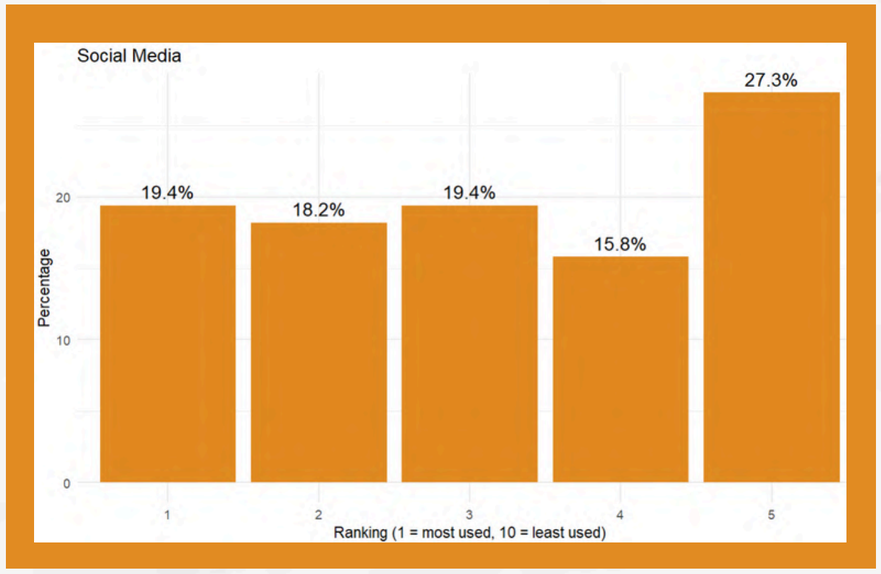

5. HOW SIGNIFICANT ARE EMERGING TRENDS (GENDERLESS PERFUMES AND SUSTAINABILITY) IN CONSUMER CHOICE?

5.1 UNIVARIATE ANALYSIS OF SOCIAL MEDIA
5.2 UNIVARIATE ANALYSIS OF SOCIAL MEDIA INFLUENCE
5.3 INCLINATION TO PURCHASE FROM SOCIAL MEDIA AND EVALUATION OF RECOMMENDATIONS
5.4 PERCEPTION OF A REFILLABLE OR GENDERLESS PERFUME
5.5 PERCEIVED IMPORTANCE OF "SUSTAINABILITY" AND THE WILLINGNESS TO PAY MORE FOR A REFILLABLE PERFUME
5.6 PERCEIVED IMPORTANCE OF “UNISEX OPTION" WHEN BUYING A PERFUME AND THE WILLINGNESS TO PAY MORE FOR IT
5.7 PARTIAL CONCLUSIONS

SOCIAL MEDIA

	Channel	Mean	Median	SD
	<chr>	<dbl>	<dbl>	<dbl>
1	Recommendations from friends/relatives	2.36	2	1.34
2	Advice from sales staff	2.96	3	1.50
3	Brand/store website	3.12	3	1.34
4	Social media	3.13	3	1.48
5	Online reviews	3.43	3	1.19

The results highlight that **recommendations from friends and relatives are the most trusted and frequently used channel**, receiving the lowest average rank (2.36) and the highest percentage of rank 1 scores (36.4%). The low standard deviation (1.34) indicates consistent preferences among respondents.

In contrast, **online reviews** have the highest average rank (3.43), making them **one of the less prioritized sources**, although their low standard deviation (1.19) shows that opinions about them are more aligned across the sample.

Social media (average rank 3.13) plays a moderate role, but **its higher standard deviation (1.48) suggests more diverse perceptions**: while some consider it highly influential, others place it much lower in their rankings.

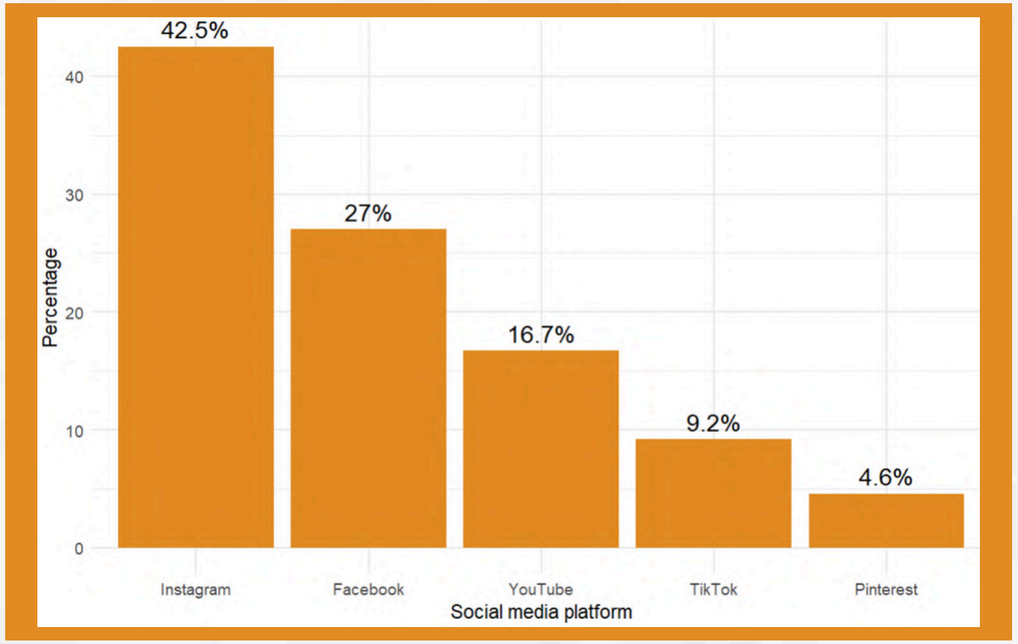

Interestingly, **advice from sales staff and brand/store websites** show similar average ranks (2.96 and 3.12), but more dispersion in responses, indicating that **their usefulness may vary depending on the shopper's profile or purchase context.**

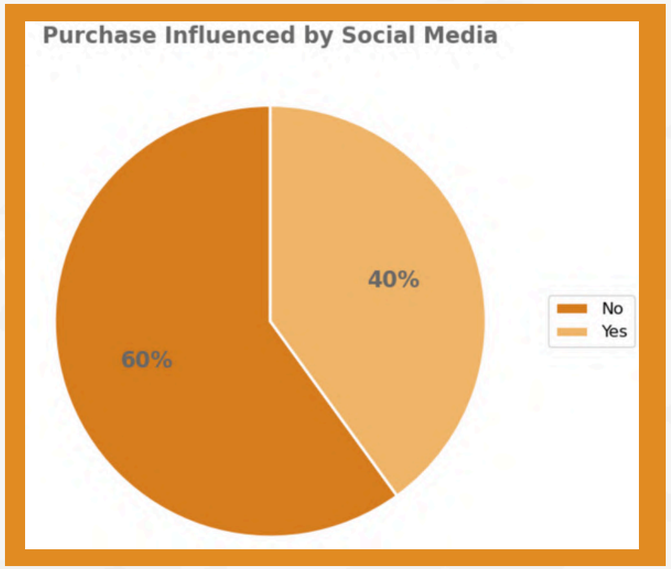

Overall, this analysis suggests that personal recommendations remain the most powerful and trusted influence in fragrance purchase decisions, while digital channels like social media and reviews play a secondary, though still significant, role.

SOCIAL MEDIA INFLUENCE

Among the surveyed respondents, **Instagram emerges as the most frequently cited social media platform**, **with 74 mentions**, indicating its strong popularity or relevance for the target audience. **Facebook follows with 47 mentions,** showing it remains significant but less dominant than Instagram. **YouTube holds a moderate position at 29 mentions**, reflecting its role as a popular content platform. **TikTok and Pinterest have fewer mentions, with 16 and 8 respectively,** suggesting they play a smaller but still relevant role in the respondents' social media preferences or usage patterns.

Overall, the data highlights Instagram's leading influence, while other platforms vary in popularity, potentially reflecting differences in user demographics, content type preferences, or marketing reach. Brands targeting this audience may prioritize Instagram but should consider tailored strategies for the other channels as well.

The majority of respondents, 60%, indicated that they would not be more inclined to purchase a perfume after seeing it on social media, suggesting that **social media exposure alone may not be a strong enough driver to influence their buying decisions**. Conversely, 40% of participants said they would be more inclined to buy after seeing the product on social media, highlighting that a substantial minority still considers social media an important factor in their purchase intent.

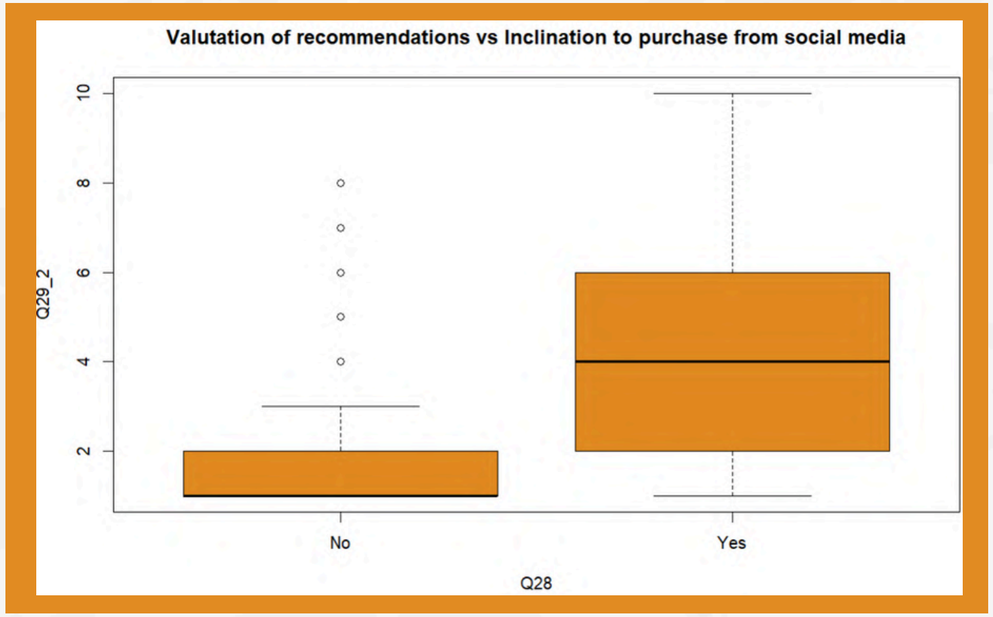

These results suggest that **while social media marketing can be effective for a significant portion of consumers, brands should complement it with other strategies to reach and persuade the majority who are less influenced by social media visibility alone**. Tailored messaging and multi-channel approaches might enhance overall purchase motivation.

INCLINATION TO PURCHASE FROM SOCIAL MEDIA AND VALUTATION OF RECOMMENDATIONS

	Df	Sum Sq	Mean Sq	F value	Pr(>F)	
Q28	1	204.2	204.17	52.88	1.2e-11	***
Residuals	172	664.1	3.86			

ETA SQUARED: = **0.2351405**

ETA: = **0.4849129**

The aim is to **verify whether those who are more likely to buy a perfume seen on social media give greater importance to the recommendations of influencers**.

The one-way ANOVA shows that **the likelihood of purchasing a perfume seen on social media has a significant effect on how much respondents value recommendations from influencers.**

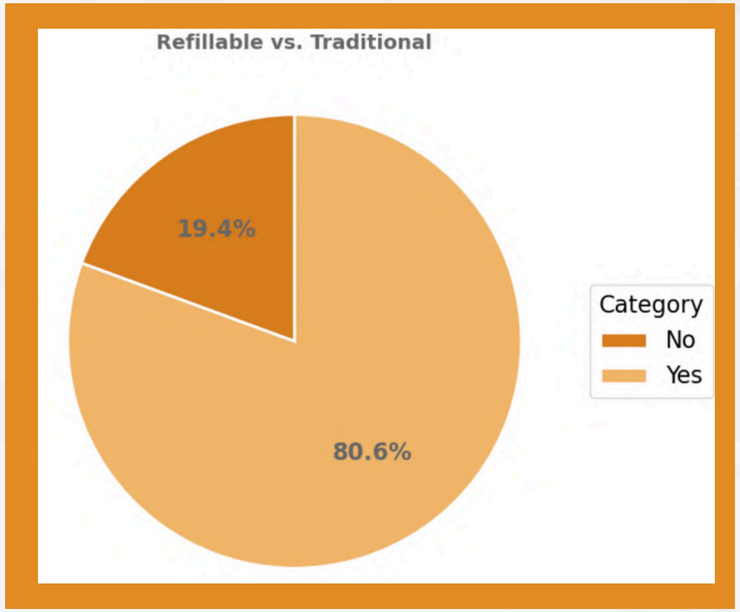

The F value is 52.88 with a p value of 1.2e-11 indicating a highly significant difference between the groups.

Participants who are more inclined to buy a perfume seen on social media tend to rate influencer recommendations as more important than those who are not.

This suggests a strong relationship between social media influence and the perceived value of influencer recommendations.

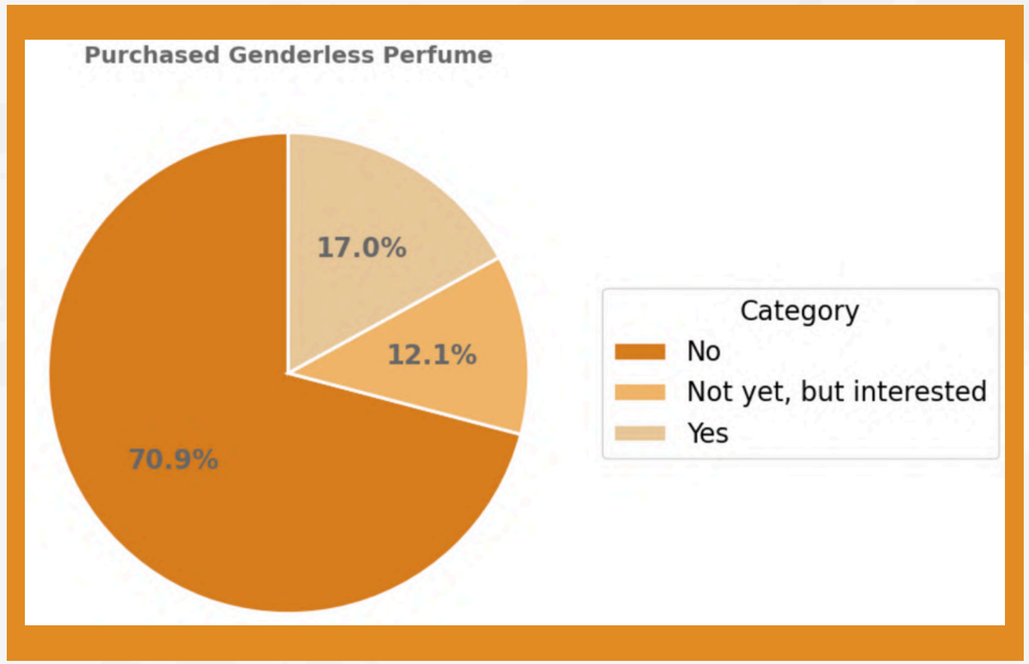

The **boxplot confirms this result**. Those who are not inclined to purchase from social media (Q28: No) show a very low probability of purchasing from influencers (median ~1). In contrast, those who are inclined to purchase from social media (Q28: Yes) show a significantly higher probability (median ~4). This indicates that **general receptivity to social media strongly influences the effectiveness of influencer marketing for perfumes.** In short, influencers are more effective on those who are already inclined to purchase via social media.

PERCEPTION

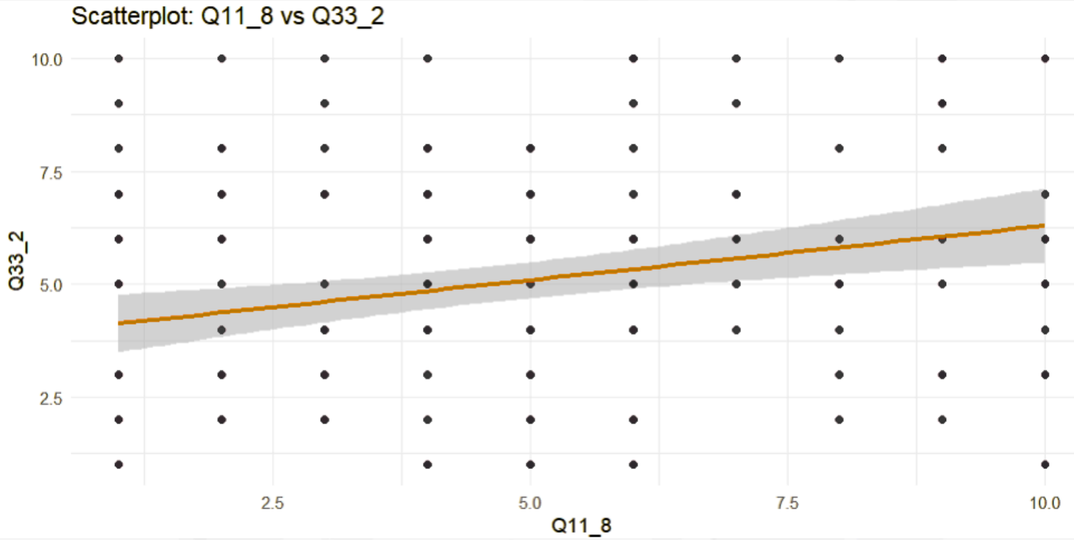

A significant majority of respondents (80.6%) indicated they would choose a **refillable perfume** over a traditional one, suggesting strong consumer interest in more sustainable and eco-friendly options. This result reflects growing environmental awareness and openness to alternative packaging models in the fragrance market.

In contrast, 72.4% of respondents have not yet purchased a **genderless perfume**, while only 16.1% have done so, and 11.5% expressed interest but haven't bought one yet. This indicates that while genderless perfumes are gaining visibility, they remain a **niche segment**. However, the portion of consumers showing interest suggests potential for growth, especially with targeted marketing and education on the concept.

PERCEIVED IMPORTANCE OF "SUSTAINABILITY" WHEN BUYING A PERFUME AND THE WILLINGNESS TO PAY MORE FOR A PERFUME WITH "REFILLABLE PACKAGING"

```
        Pearson's product-moment correlation

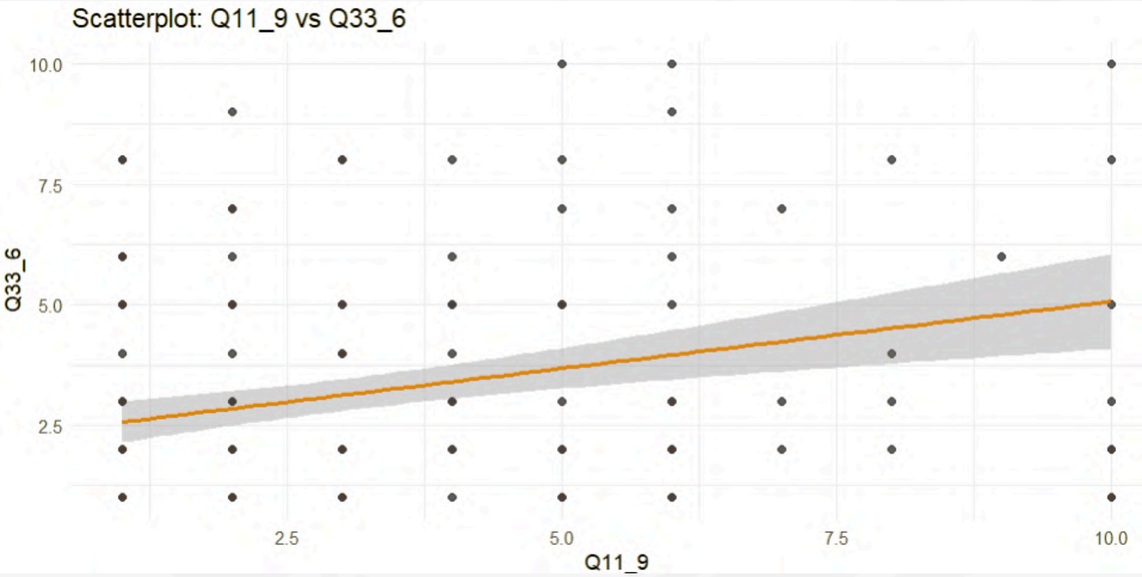

data:  data_clean$Q11_8 and data_clean$Q32_2
t = 3.4886, df = 172, p-value = 0.0006167
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 0.1125979 0.3908830
sample estimates:
      cor
0.2570617
```

The goal is to see whether those who value sustainability are also willing to pay more for refillable packaging.

The **scatterplot** shows a **positive correlation** between the importance given to sustainability (Q11_8) and the willingness to pay more for a perfume with refillable packaging (Q33_2). As the importance of sustainability increases, the willingness to spend more for refillable bottles increases. This suggests that **environmentally conscious consumers are more likely to financially support eco-friendly packaging options**. For perfume brands, highlighting the sustainability of packaging can be an effective strategy.

The correlation coefficient is 0.257, indicating a weak positive linear relationship. With a p-value of 0.0006167 (less than 0.05) and a t-statistic of 3.4886 with 172 degrees of freedom, we reject the null hypothesis, concluding that a significant positive correlation exists. The 95% confidence interval [0.1126, 0.3909] further supports this, as it does not include zero. Therefore, as the importance of sustainability increases, there's a statistically significant, albeit weak, tendency for Q32_2 to also increase.

PERCEIVED IMPORTANCE OF “UNISEX OPTION" WHEN BUYING A PERFUME AND THE WILLINGNESS TO PAY MORE FOR A "GENDERLESS PERFUME"

```
        Pearson's product-moment correlation

data:  data_clean$Q11_9 and data_clean$Q32_6
t = 4.1245, df = 172, p-value = 5.775e-05
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 0.1582985 0.4295995
sample estimates:
      cor
0.3000033
```

The goal is to see if the perceived importance of the unisex option is related to the willingness to pay for genderless perfumes.

The orange line indicates a **positive linear trend**, suggesting that as the importance of a unisex option increases, so does the willingness to pay more for a genderless perfume. The gray shaded area shows the confidence interval, reinforcing this general positive correlation. This implies that **consumers valuing gender inclusivity in fragrances are more likely to financially support genderless perfume options.**

The calculated correlation coefficient is 0.300, indicating a weak to moderate positive linear relationship between the two variables. With a very low p-value of 5.775e-05 (which is much less than 0.05) and a t-statistic of 4.1245 with 172 degrees of freedom, we can confidently reject the null hypothesis, confirming a statistically significant positive correlation. The 95% confidence interval for the correlation, ranging from 0.1583 to 0.4260, does not include zero, further supporting the existence of a real positive relationship. This suggests that as the importance of a unisex option increases for consumers, their willingness to pay for genderless perfume also tends to rise.

SOCIAL MEDIA AND TREND INFLUENCE CONCLUSIONS

- The results show that **personal recommendations from friends and relatives are still the most trusted and influential channels**, with an average score of 2.36 and 36.4% of respondents placing them in first place. They are followed, with less impact, by recommendations from sales staff (average 2.96) and brand websites (average 3.12). Social media stands at an average of 3.13, while online reviews are less relevant (average 3.43), despite the consistency in opinions.

- **Instagram emerges as the dominant social platform**, with 74 mentions, followed by Facebook (47), YouTube (29), TikTok (16) and Pinterest (8). However, only 40% of respondents said that seeing a perfume on social media would increase the likelihood of purchasing, while 60% remain indifferent, suggesting that online visibility is not enough to generate conversion without multi-channel support.

- **A particularly significant finding concerns the link between the propensity to purchase via social media and trust in influencers**: an ANOVA analysis revealed a highly significant difference ($F = 52.88$, $p = 1.2e\text{-}11$). Those willing to buy a perfume seen on social media attribute significantly greater importance to the recommendations of influencers.

- In terms of **sustainability**, 80.6% of respondents would prefer to buy a perfume with refillable packaging. A **positive correlation also emerged** ($r = 0.257$, $p = 0.0006$) **between the importance attributed to sustainability and the willingness to pay more for this type of format**. The **same** trend is observed for **genderless perfumes**, with an **even more marked correlation** ($r = 0.300$, $p = 5.775e\text{-}05$) **between the perceived importance of the unisex option and the willingness to pay a higher price**.

- Finally, although 72.4% have not yet purchased a genderless perfume, 11.5% have expressed interest, and 16.1% have already made a purchase, indicating an **emerging market segment to target with inclusive strategies and targeted communication**.

- In summary, the data suggests that consumer choices in the world of perfumery are driven by a mix of tradition and innovation: interpersonal trust, environmental sustainability and gender inclusiveness are increasingly strategic levers, while the power of social media requires a more targeted and segmented approach to express its full potential.

6. DIOR AND ITS PRODUCTS

6.1 DIOR PERCEPTION

6.2 DIOR CONSUMERS

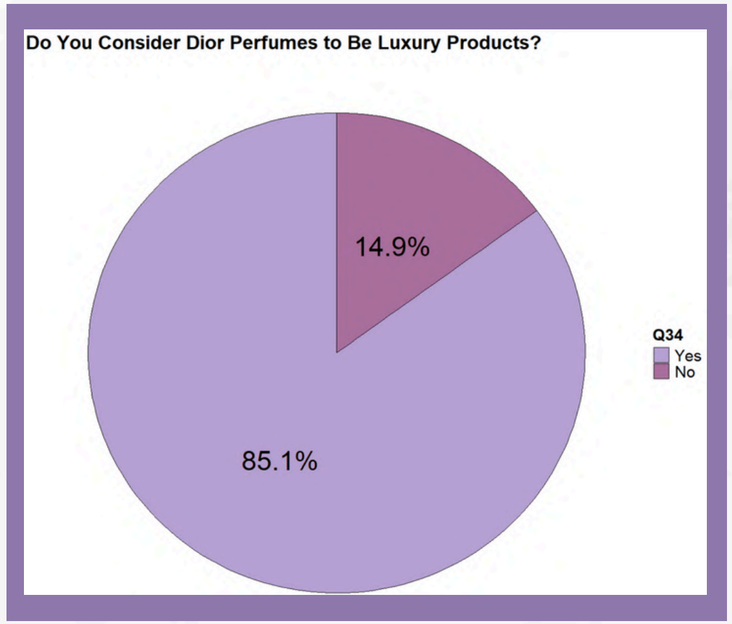

6.3 IMPORTANT FACTORS FOR CHOOSING YOUR NEXT DIOR FRAGRANCE

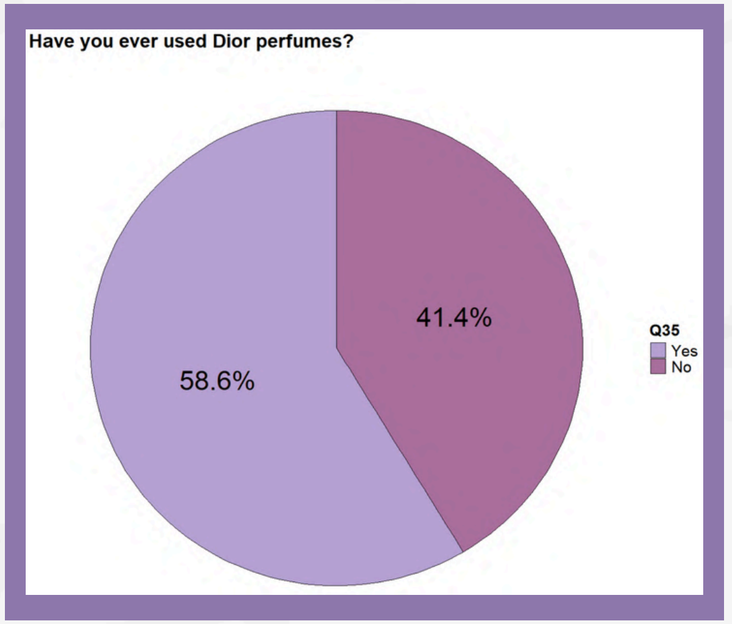

6.4 DIOR SATISFACTION

6.5 NPS

6.6 PARTIAL CONCLUSION

DIOR PERCEPTION

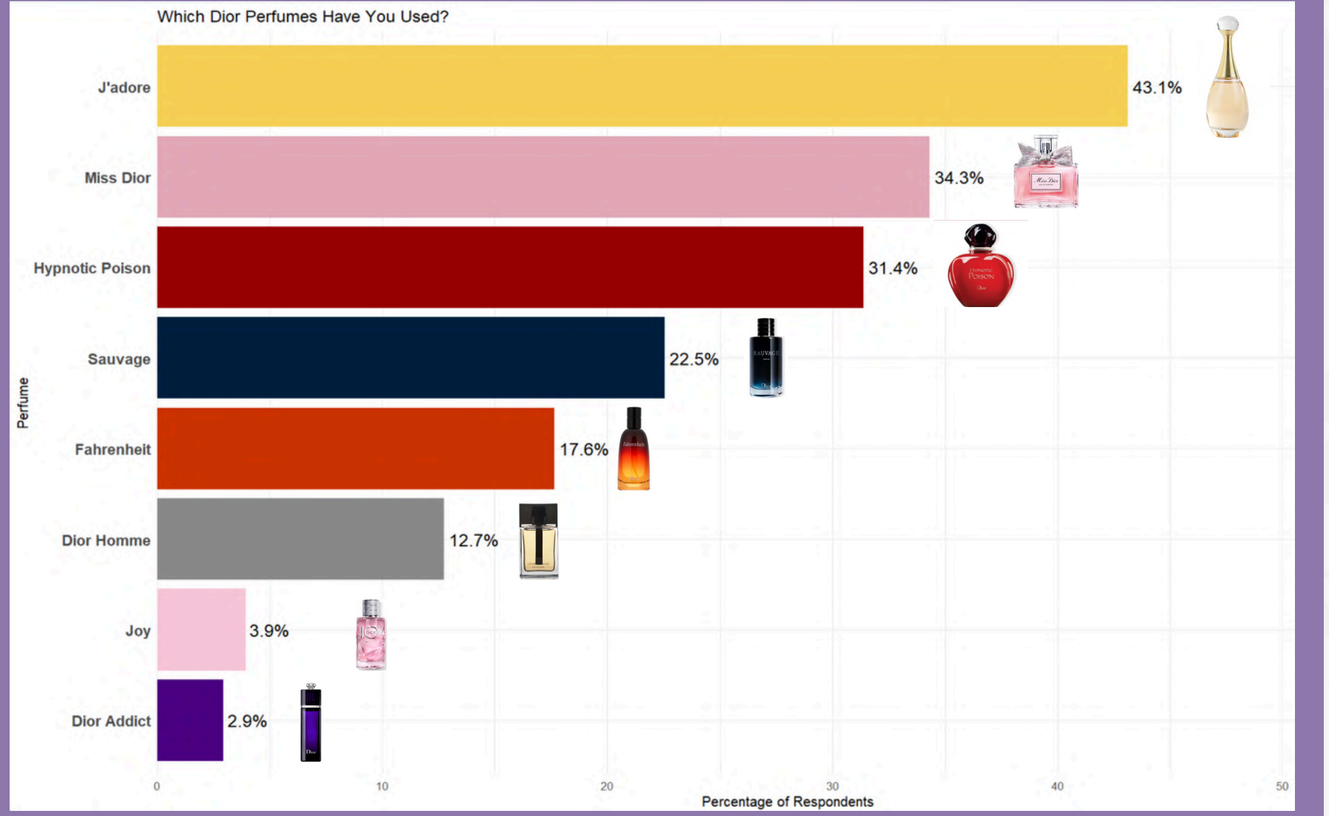

The first chart shows that **85.1%** of respondents consider Dior perfumes to be luxury products, confirming a **strong brand positioning in the high-end segment.**

The second chart shows that only 41.4% of respondents have actually used Dior perfumes, while **58.6% have never experienced the product** firsthand.

This **contrast** suggests that **Dior's luxury image is widely recognized, even by non-users**. This means that over half of the sample (58.6%) **recognizes Dior's value without ever having engaged with the product directly**. The brand has cultural capital, but conversion into product experience is not universal. This **gap** between brand awareness and product experience highlights a significant **strategic opportunity**: Dior could activate this potential through first-purchase incentives, entry-level formats, travel sizes, or targeted sampling strategies to convert admirers into actual users.The data suggests that the barrier is not brand perception, but perhaps price, accessibility, or habit—areas worth exploring through deeper segmentation.

DIOR CONSUMERS

The analysis shows that among the various Dior perfumes, **J'adore** is by far the most commonly used, with **43.1%** of respondents having experienced it. This is followed by **Miss Dior (34.3%)** and **Hypnotic Poison (31.4%)**, while other iconic lines such as **Sauvage (22.5%)** also show a solid user base.
On the other hand, more niche products like **Joy (3.9%)** and **Dior Addict (2.9%)** are significantly **less familiar** to the sample.

This helps understanding usage patterns of Dior perfumes and can be leveraged to:

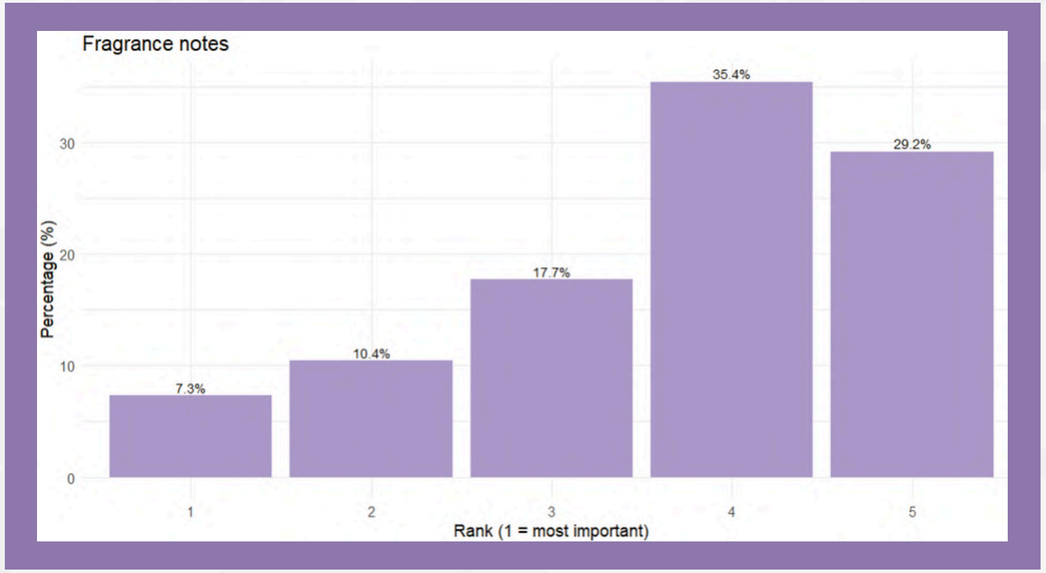

- prioritize **investment in high-performing lines** (loyalty campaigns or new editions);
- **reassess communication efforts for lesser-known products;**
- potentially **reposition certain lines toward niche targets** rather than the general public.

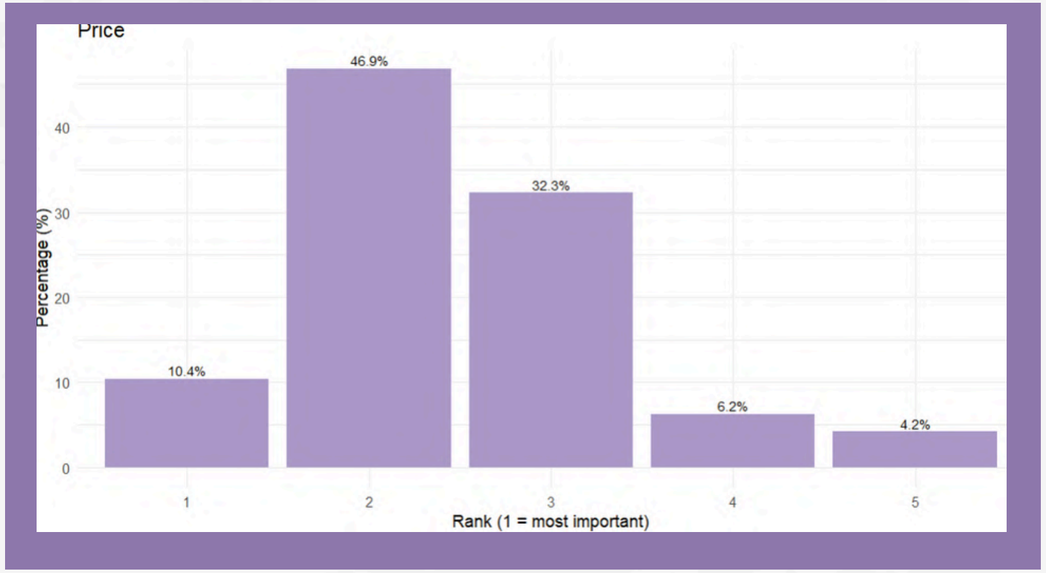

It can also be useful to **further analyze the profiles of consumers** who choose each perfume, in order to identify which target groups to focus on in future communication strategies, and what preferences drive the selection of less popular products.

IMPORTANT FACTORS IN THE CHOICE OF YOUR NEXT DIOR FRAGRANCE

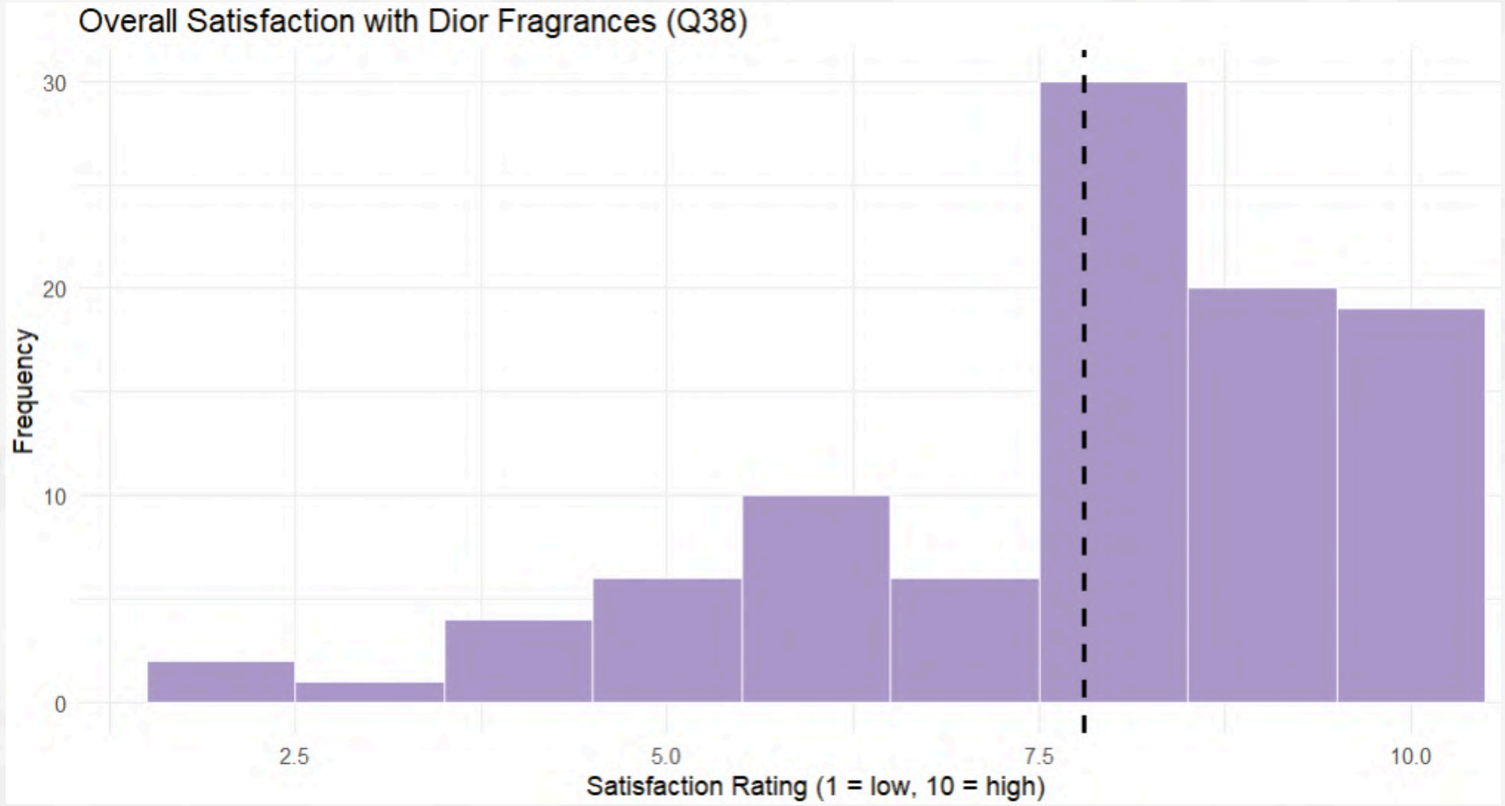

The analysis of important factors in perfume choice reveals **fragrance notes as the most crucial**, with a mean rank of 1.88 and 36.6% of respondents ranking them first. **Longevity follows** closely as the second most important (mean 2.48), indicating its high relevance. **Price ranks third** (mean 2.72), with nearly half (49.9%) of respondents placing it second. **Packaging** (mean 3.66) **and the ability to test** (mean 4.26) **are considered significantly less important**. In summary, a perfume's intrinsic quality (fragrance and longevity) and its cost are the primary drivers for consumers.

	Factor	Mean	Median	SD
	<chr>	<dbl>	<dbl>	<dbl>
1	Fragrance notes	1.88	1	1.3
2	Longevity	2.48	2	0.94
3	Price	2.72	3	1.14
4	Packaging	3.66	4	1.22
5	Ability to test	4.26	5	1.03

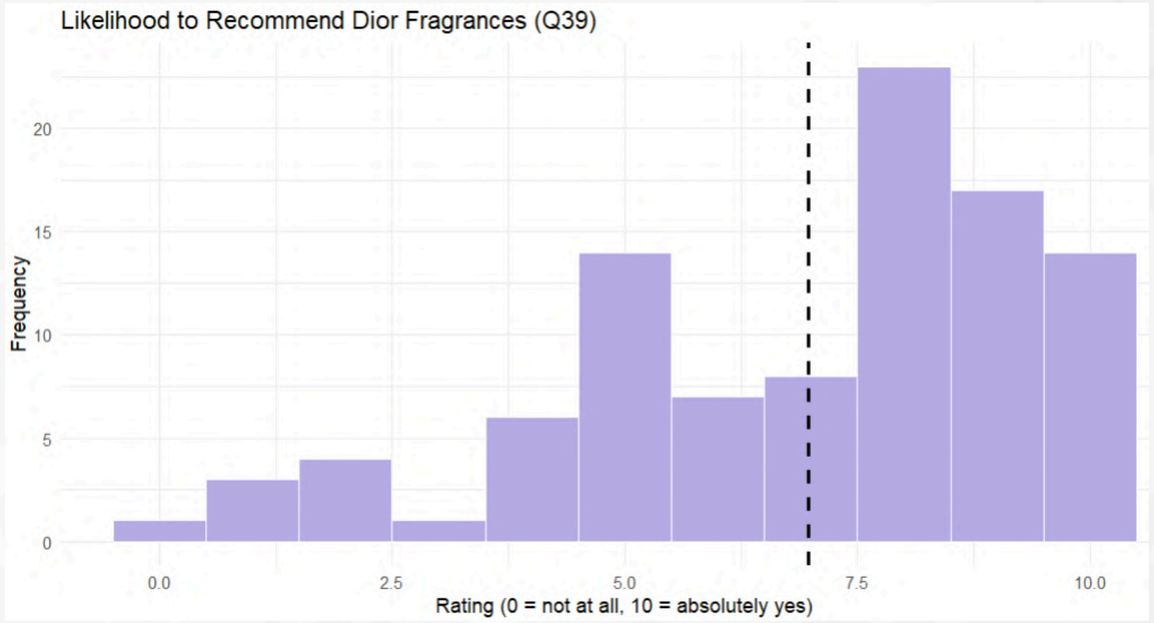

SATISFACTION

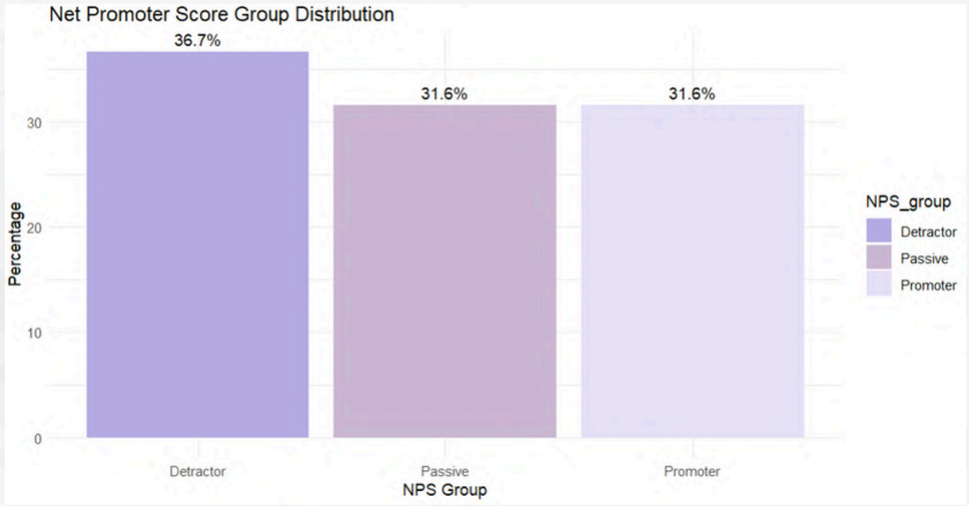

An average of 7.81 indicates a good level of overall satisfaction among respondents. This suggests that, on average, users are generally satisfied with the brand, although not fully enthusiastic. The result is positive, but highlights the presence of aspects that could be optimized to reach higher levels of excellence (over 8.5).

NPS

The "Likelihood to Recommend Dior Fragrances (Q39)" histogram shows the distribution of customer responses regarding their likelihood to recommend Dior fragrances, on a scale of 0 to 10. **There is a notable concentration of responses toward the highest scores, particularly 9 (with the highest frequency) and 10, followed by 8.** This indicates the presence of a highly satisfied and enthusiastic customer segment, ready to actively promote the brand. However, the distribution is not exclusively skewed upward; there are also frequencies, albeit lower, for lower scores (0 to 6), representing customers less likely to recommend. The dotted line at 7.5 serves as a visual divide for the NPS categories. Overall, the shape of the histogram suggests a mixed bag of opinions, with a core of strong promoters but also a non-negligible base of less enthusiastic customers.

The second histogram, "Net Promoter Score Group Distribution," clearly categorizes respondents: **Detractors** (scores 0-6) make up the largest share at 36.7%. **Passives** (scores 7-8) and **Promoters** (scores 9-10) both account for 31.6%. Applying the NPS formula (% Promoters - % Detractors), we get a score of 31.6% - 36.7% = -5.1%. This negative NPS of -5.1% is a significant indicator: it suggests that, despite a significant number of Promoters, Dior fragrances faces a challenge due to a dissatisfied or unenthusiastic customer base (Detractors) that outnumbers its most loyal ambassadors. An NPS in negative territory typically signals the need for strategic interventions to improve the customer experience and overall brand perception.

DIOR CONCLUSIONS

- **Dior** maintains a strong luxury brand perception, with **85.1% of respondents considering its perfumes luxury products**, confirming its high-end market positioning. However, this perception doesn't fully translate into direct product experience, as **only 41.4% of respondents have actually used Dior perfumes, while 58.6% have never done so**. This gap highlights a strategic opportunity to convert admirers into actual users, as the barrier is likely not brand image but potentially price, accessibility, or habit.

- Among those who have used Dior perfumes, **J'adore is the most commonly experienced** at 43.1%, followed by Miss Dior (34.3%) and Hypnotic Poison (31.4%), while niche products like Joy (3.9%) and Dior Addict (2.9%) are significantly less familiar. When choosing a perfume, **fragrance notes are deemed most crucial** with a mean rank of 1.88, with 36.6% ranking them first, closely followed by longevity (mean 2.48) and price (mean 2.72), where 49.9% placed it second, affirming that intrinsic quality and cost are primary drivers. Additionally, **consumers generally more inclined to purchase perfume from social media** (Q28: Yes) show a higher likelihood to buy from influencer-sponsored content (Q29_2 median around 4), whereas those not generally inclined (Q28: No) show a very low likelihood (Q29_2 median around 1). There is also a **positive correlation between the importance of sustainability** (Q11_8) **and the willingness to pay more for refillable packaging** (Q33_2), with a Pearson correlation of 0.257 and a p-value of 0.0006167. Similarly, a **positive correlation exists between valuing a unisex option** (Q11_9) **and willingness to pay for genderless perfume** (Q33_6), with a Pearson correlation of 0.300 and a p-value of 5.775e-05.

- Despite an **average overall satisfaction rating of 7.81 for Dior fragrances**, indicating a good level but not full enthusiasm, **the Net Promoter Score (NPS) stands at -5.1%**. This negative NPS is a critical finding, derived from 36.7% Detractors, 31.6% Passives, and 31.6% Promoters. It signifies that the number of dissatisfied or unenthusiastic customers (Detractors) outweighs the loyal Promoters, suggesting a clear need for strategic interventions to enhance the customer experience and overall brand perception for Dior fragrances.

7. DEMAND SEGMENTATION

7.1 CLUSTER ANALYSIS
7.2 CORRELATION ANALYSIS
7.3 K-MEAN CLUSTER ANALYSIS
7.4 ANOVA AND FINAL CLUSTER CENTERS
7.5 CLUSTER DESCRIPTION
7.6 SOCIO-DEMOGRAPHIC VARIABLES VS CLUSTERS
7.7 PREFUME USAGE FREQUENCY VS CLUSTERS
7.8 CLUSTER CHARACTERISTICS CONCLUSIONS

CLUSTER ANALYSIS

The cluster analysis aims to group customers into distinct segments, revealing unique consumer profiles for Dior Parfums.
This segmentation is based on some variables that capture **perceptions of luxury, purchase drivers, and usage habits**, offering a comprehensive view of consumer preferences and behaviors**.** The variables are:

DRIVERS OF CHOICE:

- Q11_1 - Price
- Q11_3 - Fragrance notes
- Q11_5 - Longevity
- Q11_8 - Sustainability

CHANNELS:

- Q16_1 - Social media
- Q16_4 - Recommendations from friends/relatives

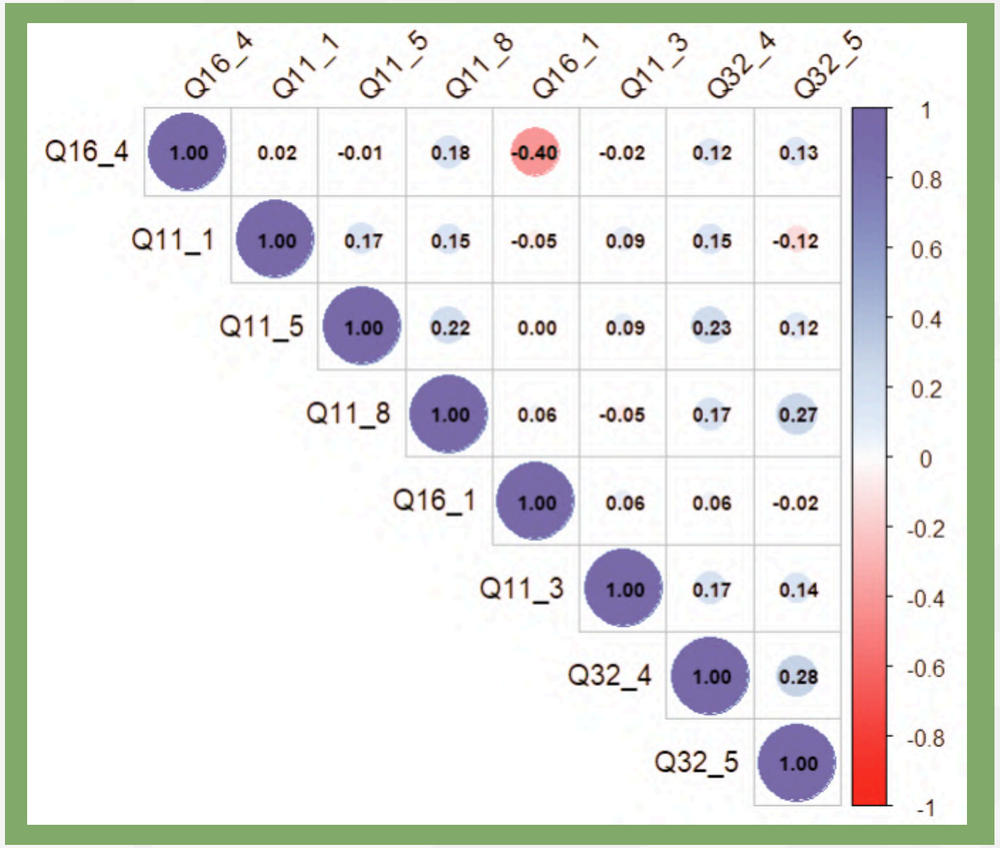

WILLINGNESS TO PAY FOR PERFUME ATTRIBUTES:

- Q32_4 - Free from allergens or irritants
- Q32_5 - Personalized perfumes

The variables are carefully selected, also using information from earlier analysis to make sure we understood customers' thoughts and actions. These variables are picked to create an Analytical Base Table (ABT), a tool that underpins the ability to uncover distinct consumer segments, providing a robust foundation for Dior's strategic decisions across selling, targeting, innovation, and communication.

The cluster analysis is performed across a population size of 165, instead of 174 as the total number of partecipants of the survey. This is due to the presence of null values in the variable analysing the social media influence.

CORRELATION ANALYSIS

The **correlation matrix** analysis precisely reveals the linear relationships between the variables, visually highlighted by a range of blue and red circles: the former indicate positive correlations, the latter negative. The color intensity and size of the circles elegantly represent the strength of the relationship, while the Pearson coefficients quantify its exact value.

Beyond the autocorrelations, several moderate connections emerge between the variables. For example, Q11_8 Sustainability and Q32_5 Personalized Perfumes show a **positive correlation** of 0.27, while Q32_4 Free from Allergens is in harmony with Q32_5 at 0.28. Q11_5 Longevity also correlates with both Q11_8 (0.22) and Q32_4 (0.23). These patterns suggest a consumer tendency: **those who value one characteristic tend to also appreciate other similar ones.**

A **moderate negative correlation** was found between Q16_1 (Social Media) and Q16_4 (Friend Recommendations), with a Pearson coefficient of –0.40. This suggests that individuals who rely more on digital sources tend to rely less on personal recommendations, and vice versa.
Precisely because this correlation highlights a divergence in consumer behavior, we decided to keep both variables in the dataset. They capture complementary influence dynamics that are essential for identifying distinct consumer profiles in the segmentation analysis.

K-MEANS CLUSTER ANALYSIS

Clustering models are mainly divided into:

- **Hierarchical**, which that group data into a tree structure, without requiring a predefined number of clusters;
- **Non-hierarchical**, which start from a predefined number of clusters and iteratively optimize them.

We initially applied the **K-means algorithm** to identify the optimal clustering of our population. To evaluate the most meaningful segmentation, we tested different cluster solutions by setting the number of clusters to 3, 4, and 5, respectively. The resulting **population** distributions were as follows:

- 3 clusters: 76, 37, 52
- 4 clusters: 36, 41, 44, 44
- 5 clusters: 40, 24, 19, 45, 37

After analyzing the outcomes, **we selected the 4-cluster solution as the most balanced and interpretable configuration**. This option avoids the excessive aggregation seen in the 3-cluster model and the fragmentation observed with 5 clusters, which risked producing subgroups too small to yield meaningful insights. The 4-cluster segmentation offers a more even distribution across groups and facilitates clearer differentiation in consumer profiles, making it the most suitable choice for subsequent analysis and strategic targeting.

CLUSTER	1	2	3	TOTAL
SIZE	76	37	52	165
PERCENTAGE	46%	22%	32%	100%

CLUSTER	1	2	3	4	TOTAL
SIZE	36	41	44	44	165
PERCENTAGE	22%	25%	27%	27%	100%

CLUSTER	1	2	3	4	5	TOTAL
SIZE	40	24	19	45	37	165
PERCENTAGE	24%	15%	12%	27%	22%	100%

ANOVA & FINAL CLUSTER CENTERS

An **ANOVA (Analysis of Variance)** was performed for each variable to assess whether mean scores significantly differed across the identified clusters—an essential step in validating the robustness of our segmentation.

The "**Final Cluster Centers**" table displays the centroids of each cluster, representing the average standardized values of the variables used in the segmentation.

ANOVA						
	CLUSTER MEAN SQUARE	DF	MEAN SQUARE ERROR	DF	F	SIG.
Q11_1	8.948	4	0.801	160	11.17	5.15e-08***
Q11_3	7.098	4	0.848	160	8.374	3.69e-06***
Q11_5	11.060	4	0.749	160	14.78	2.7e-10***
Q11_8	11.467	4	0.738	160	15.53	9.36e-11***
Q16_1	25.335	4	0.392	160	64.69	<2e-16***
Q16_4	20.429	4	0.514	160	39.73	<2e-16***
Q32_4	11.876	4	0.728	160	16.31	3.17e-11***
Q32_5	19.948	4	0.526	160	37.9	<2e-16***

FINAL CLUSTER CENTERS

	Q11_3	Q11_5	Q11_1	Q11_8	Q32_4	Q32_5	Q16_1	Q16_4
Cluster 1	-0.2292	-0.1896	0.1736	-0.1949	-0.2272	-0.3922	-1.0506	0.9010
Cluster 2	0.4571	0.6579	-0.2005	0.9255	0.8815	1.1524	0.0225	0.5727
Cluster 3	-0.6150	-1.3629	-0.9708	-0.4030	-0.8789	-0.1854	0.3684	-0.6278
Cluster 4	0.1973	0.3690	0.3512	-0.1354	0.0985	-0.1826	0.6269	-0.6958

The results show **consistently high F-statistics and extremely low p-values**, confirming strong differentiation across clusters. For instance, variables like Q11_1, Q11_5, and Q11_8 showed F-values above 11, with p-values ranging from 5.15e-08 to 9.36e-11. Even stronger effects were observed for Q16_1 and Q16_4 (F = 64.69 and 39.73, respectively), both with p < 2e-16. Similarly, product-related variables like Q32_4 and Q32_5 recorded F-values of 16.31 and 37.90, also with extremely low significance levels. These results clearly indicate that the mean differences across clusters are statistically significant for all variables analyzed, **confirming the validity and discriminative power of the chosen 4-cluster solution**.

To improve readability, we applied a color gradient: **strongly positive values are shown in green**, and **strongly negative ones in red**. Light green highlights moderately positive scores (around +0.30 to +0.50), while light red indicates moderately negative scores (from -0.30 to -0.50). This visual approach helps quickly identify meaningful deviations from the average (zero), offering insights into which variables most contribute to the distinct identity of each cluster.

CLUSTER DESCRIPTION

COLLECTIVE MINDED

21,82% OF INDIVIDUALS

This cluster is passive and heavily reliant on word-of-mouth. They dislike online communication and are not drawn to modern or innovative features. Likely older, they trust only the opinions of people close to them.

MOST RELEVANT ATTRIBUTES:

- ✅ RECCOMENDATION FROM FRIENDS (+0.90)
- ❌ SOCIAL MEDIA (-1.05)
- ❌ PERSONALISED PERFUMES (-0.39)

ETHICAL PERFECTIONIST

24,85% OF INDIVIDUALS

This is the most valuable cluster. They are enthusiastic, highly engaged, and demanding, but willing to pay more for features related to the experience of the fragrance (notes, longevity) and ethical values and wellbeing (sustainability, allergen-free)

MOST RELEVANT ATTRIBUTES:

- ✅ SUSTAINABILITY (+0.9255)
- ✅ PERSONALIZED PERFUMES (+1.1524)
- ✅ FREE FROM ALLERGENS (+0.8815)

DIGITAL TREND FOLLOWER

26,67% OF INDIVIDUALS

This is a resistant, disenchanted cluster, likely disappointed or skeptical. They are very difficult to convert through traditional messaging. They show mild openness to social media, but prefer raw content, nothing overly salesy.

MOST RELEVANT ATTRIBUTES:

- ❌ NEGATIVE ON PERFUME ATTRIBUTES
- ❌ NOT INTERESTED IN TRENDS
- ✅ SLIGHTLY POSITIVE ON SOCIAL MEDIA

STRATEGIC NICHE SEEKER

26,67% OF INDIVIDUALS

This cluster is rational, selective, and digitally oriented. They approach decisions weighing value and product performance. While they're open to information and comparison, they tend to reject word-of-mouth.

MOST RELEVANT ATTRIBUTES:

- ✅ LONGEVITY (+0.3690)
- ✅ PRICE (+0.3512)
- ✅ SOCIAL MEDIA (+0.6269)
- ❌ RECOMMENDATIONS (-0.6958)

LOCATION BY CLUSTERS

```
        Pearson's Chi-squared test

data:  tabella
X-squared = 6.7431, df = 6, p-value = 0.3453
```

A Chi-squared test was conducted to examine the distribution of location across the four identified behavioral clusters. The test yielded $X^2 = 6.7432$, df = 6, with a p-value = 0.3453, indicating no statistically significant association between the location and cluster membership. In other words, the observed differences could be due to chance.

Location	Collective-minded	Ethical perfectionist	Digital trend follower	Strategic niche-seeker

Total percent	6,06%	5,45%	9,70%	10,30%	

Cluster analysis

- **Collective-minded:** 25% Milano, 47,22% Roma, 27,78% Vicenza → Clear Roma majority
- **Ethical perfectionist:** 43,9% Milano, 34,15% Roma, 21,95% Vicenza → Clear Milano majority
- **Digital trend follower:** 34,09% Milano, 29,55% Roma, 36,36% Vicenza → Fairly balanced
- **Strategic niche-seeker:** 29,55% Milano, 31,82% Roma, 38,64% Vicenza → moderate Vicenza majority

Location analysis

Milano

- 16,36% collective-minded
- 37,73% ethical perfectionist
- 27,27% digital trend follower
- 23,64% strategic niche-seeker

Roma

- 29,31% collective-minded
- 24,14% ethical perfectionist
- 22,41% digital trend follower
- 24,14% strategic niche-seeker

Vicenza

- 19,23% collective-minded
- 17,31% ethical perfectionist
- 30,77% digital trend follower
- 32,69% strategic niche-seeker

Partial conclusion: The bivariate analysis between the identified consumer clusters and geographic location (Milan, Rome, and Vicenza) reveals **no statistically significant association** (p-value = 0.34). This indicates that the distribution of consumer profiles is **relatively balanced across the three cities**. For example, **Milan** shows a slightly **higher share of Ethical Perfectionists (37.73%)**, while **Rome** has a notable concentration of **Collective-Minded individuals (29.31%)**, and **Vicenza** presents a larger portion of **Digital Trend Followers (30.77%)** and **Strategic Niche-Seekers (32.69%)**. However, these differences are not strong enough to be statistically meaningful or predictive of distinct purchasing behaviors by location.Given the lack of significant correlation, it is unnecessary to design radically different marketing or product strategies tailored to each city. Instead, Dior would benefit from implementing broad, unified strategies that appeal across all locations, focusing on the shared values and preferences observed in the overall sample.

AGE BY CLUSTERS

```
        Pearson's Chi-squared test

data:  tabella
X-squared = 10.909, df = 3, p-value = 0.01223
```

A Chi-squared test was conducted to examine the distribution of gender (male vs. female) across the four identified behavioral clusters. The test yielded $X^2 = 10.909$, df = 3, with a p-value = 0.01223, indicating a statistically significant association between gender and cluster membership at the conventional 0.05 significance level. In other words, the observed differences in gender distribution across clusters are unlikely to be due to chance. This suggests that gender plays a role in how individuals are distributed among the behavioral clusters.

	Cluster				
Age	**Collective-minded**	**Ethical perfectionist**	**Digital trend follower**	**Strategic niche-seeker**	
					Row total
18-30					
Count	17	23	10	21	71
Row percent	23,94%	32,39%	14,08%	29,58%	
Column percent	47,22%	56,10%	22,73%	47,73%	
Total percent	10,30%	13,94%	6,06%	12,73%	
50-65					
Count	19	18	34	23	94
Row percent	20,21%	19,15%	36,17%	24,47%	
Column percent	52,78%	43,90%	77,27%	52,27%	
Total percent	11,52%	10,91%	20,61%	13,94%	
Column total count	36	41	44	44	165

Cluster analysis

- **Collective-minded:** 47,22% 18-30, 52,78% 50-65 → Balanced
- **Ethical perfectionist:** 56,10% 18-30, 43,90% 50-65 → Moderate 18-30 majority
- **Digital trend follower:** 22,73% 18-30, 77,27% 50-65 → Clear 50-65 majority
- **Strategic niche-seeker:** 47,73% 18-30, 52,27% 50-65 → Balanced

Age analysis

18-30 years

- 23,94% collective-minded
- 32,39% ethical perfectionist
- 14,08% digital trend follower
- 29,58% strategic niche-seeker

50-65 years

- 20,21% collective-minded
- 19,15% ethical perfectionist
- 36,17% digital trend follower
- 24,47% strategic niche-seeker

Partial conclusion: The bivariate analysis between consumer clusters and age groups (18–30 vs. 50–65) reveals a **statistically significant association (p-value = 0.01223)**, indicating that age plays a **meaningful role in shaping consumer mindsets in the luxury perfume market.** This result has direct implications for Dior's segmentation and communication strategy. Y**ounger consumers (18–30)** are more likely to belong to the **Ethical Perfectionist (32.39%)** and **Strategic Niche-Seeker (29.58%)** clusters. **Older consumers (50–65)** show a strong presence in the **Digital Trend Follower cluster (36.17%)**, significantly higher than their younger counterparts (14.08%). The **Collective-Minded cluster is fairly balanced** across both age groups, with a slight majority in the older segment. Even the significant impact of age on consumer attitudes and preferences, Dior should incorporate age-based segmentation into its marketing strategy. Communication style, platform selection, and product focus can be adjusted to reflect generational differences. Therefore, Dior should develop targeted yet cohesive strategies that speak effectively to each age group.

GENDER BY CLUSTERS

```
        Pearson's Chi-squared test

data:  Gender_Cluster
X-squared = 1.6895, df = 3, p-value = 0.6393
```

A Chi-squared test was conducted to examine the distribution of gender (male vs. female) across the four identified behavioral clusters.
The test yielded $X^2 = 1.6895$, df = 3, with a p-value = 0.6393, indicating no statistically significant association between gender and cluster membership. In other words, the observed differences could be due to chance.

	Cluster				
Gender	**Collective-minded**	**Ethical perfectionist**	**Digital trend follower**	**Strategic niche-seeker**	
					Row total
Female					
Count	19	21	28	26	94
Row percent	20,21%	22,34%	29,79%	27,66%	
Column percent	52,78%	51,22%	63,64%	59,09%	
Total percent	11,52%	12,73%	16,97%	15,76%	
Male					
Count	17	20	16	18	71
Row percent	23,94%	28,17%	22,54%	25,35%	
Column percent	47,22%	48,78%	36,36%	40,91%	
Total percent	10,30%	12,12%	9,70%	10,91%	
Column total count	36	41	44	44	165

Cluster analysis

- **Collective-minded**: 52.78% women, 47.22% men → fairly balanced.
- **Ethical perfectionist**: 51.22% women, 48.78% men → also balanced.
- **Digital trend follower**: 63.64% women, 36.36% men → **clear female majority**
- **Strategic niche-seeker:** 59.09% women, 40.91% men → moderate female skew.

Gender analysis

Women

- Collective-minded (20.21%)
- Ethical perfectionist (22,34%)
- **Digital trend follower (29.79%)**
- **Strategic niche-seeker (27.66%)**

Men

- Collective-minded (23.94%)
- **Ethical perfectionist (28.17%)**
- Digital trend follower (22.54%)
- Strategic niche-seeker (25.35%)

Partial Conclusion: Although the Chi-squared test indicates n**o statistically significant association** between gender and behavioral clusters (p = 0.6393 higher than common threshold of 0.05), the descriptive data reveal interesting tendencies worth noting. **Women** appear slightly more concentrated in **Digital trend follower** (29.79% of women) and **Strategic niche-seeker** (27.66%), while **men show a more even distribution**, with a mild preference for **Ethical perfectionist** (28.17% of men) profile.
This suggests that while gender does not strongly determine cluster affiliation, gender-related nuances may still be useful for developing tailored marketing or communication strategies. Specifically, positioning efforts targeting innovation and trend sensitivity may resonate more with a female audience, while messages grounded in ethics, ideals, or collectivism may appeal more broadly across genders.

LEVEL OF EDUCATION BY CLUSTERS

```
        Pearson's Chi-squared test

data:  tabella_Q44
X-squared = 6.7831, df = 6, p-value = 0.3414
```

A Chi-squared test was conducted to examine the distribution of education level across the four identified behavioral clusters. The test yielded $X^2 = 6.7831$, df = 6, with a p-value = 0.3414, indicating no statistically significant association between education level and cluster membership. In other words, the observed differences could be due to chance.

	Cluster				
Level of education	**Collective-minded**	**Ethical perfectionist**	**Digital trend follower**	**Strategic niche-seeker**	
					Row total
Middle school					
Count	3	1	2	0	6
Row percent	50,00%	16,67%	33,33%	0,00%	
Column percent	8,33%	2,44%	4,55%	0,00%	
Total percent	1,82%	0,61%	1,21%	0,00%	
High school					
Count	17	16	19	15	67
Row percent	25,37%	23,88%	28,36%	22,39%	
Column percent	47,22%	39,02%	43,18%	34,09%	
Total percent	10,30%	9,70%	11,52%	9,09%	
College degree					
Count	16	24	23	29	92
Row percent	17,39%	26,09%	25,00%	31,52%	
Column percent	44,44%	58,54%	52,27%	65,91%	
Total percent	9,70%	14,55%	13,94%	17,58%	
Column total count	36	41	44	44	165

Cluster analysis

- **Collective-minded:** 8.33% Middle school, 47.22% High school, 44.44% College degree → more concentrated in lower and medium education.
- **Ethical perfectionist:** 2.44% Middle school, 39.02% High school, 58.54% College degree → increases with education level.
- **Digital trend follower**: 4.55% Middle school, 43.18% High school, 52.27% College degree → balanced but slightly higher at higher levels.
- **Strategic niche-seeker:** 0% Middle school, 34.09% High school, 65.91% College degree → strongly skewed toward highest education level.

Level of education analysis

Middle school

- Collective minded (50%)
- Ethical perfectionist (16.67%)
- Digital trend follower (33.33%)
- Strategic niche-seeker (0%)

High school

- Collective minded (25.37%)
- Ethical perfectionist (23.88%)
- Digital trend follower (28.36%)
- Strategic niche-seeker (22.39%)

College degree

- Strategic niche-seeker (31.52%)
- Ethical perfectionist (26.09%)
- Digital trend follower (25.00%)
- Collective minded (17.39%)

Partial conclusion: The bivariate analysis between consumer clusters and level of education (Q44) indicates no statistically significant association (p-value > 0.05 (i.e. = 0.34)). The distribution of education levels within each cluster shows some variation: the Strategic Niche-Seeker cluster includes the largest proportion of college degree individuals (31.52%), while the Collective-Minded cluster has the highest share of middle school level respondents (50%). Despite these differences, the lack of statistical significance suggests that education level does not meaningfully distinguish between the identified consumer profiles. Therefore, targeted strategies based on education level are not justified, and further analysis should be recommended.

EMPLOYMENT STATUS BY CLUSTERS

```
        Pearson's Chi-squared test

data:  tabella_Q45
X-squared = 12.159, df = 6, p-value = 0.05852
```

A Chi-squared test was conducted to examine the distribution of employment status across the four identified behavioral clusters. The test yielded $X^2 = 12.159$, df = 6, with a p-value = 0.05852, indicating no statistically significant association between employment status and cluster membership. In other words, the observed differences could be due to chance.

	Cluster				
Level of education	**Collective-minded**	**Ethical perfectionist**	**Digital trend follower**	**Strategic niche-seeker**	
					Row total
Unemployed					
Count	0	2	1	1	4
Row percent	0,00%	50,00%	25,00%	25,00%	
Column percent	0,00%	4,88%	2,27%	2,27%	
Total percent	0,00%	1,21%	0,61%	0,61%	
Employed					
Count	23	20	36	26	105
Row percent	21,90%	19,05%	34,29%	24,76%	
Column percent	63,89%	48,78%	81,82%	59,09%	
Total percent	13,94%	12,12%	21,82%	15,76%	
Student					
Count	13	19	7	17	56
Row percent	23,21%	33,93%	12,50%	30,36%	
Column percent	36,11%	46,34%	15,91%	38,64%	
Total percent	7,88%	11,52%	4,24%	10,30%	
Column total count	36	41	44	44	165

Cluster analysis

- **Collective-minded**: 0.00% unemployed, 63.89% employed, 36.11% student → strongly concentrated among employed.
- **Ethical perfectionist:** 4.88% unemployed, 48.78% employed, 46.34% student → high share of unemployed and students.
- **Digital trend follower:** 2.27% unemployed, 81.82% employed, 15.91% student → clear majority employed.
- **Strategic niche-seeker**: 2.27% unemployed, 59.09% employed, 38.64% student → mostly employed, but also students.

Employment status analysis

Unemployed

- Ethical perfectionist (50.00%)
- Digital trend follower (25.00%)
- Strategic niche-seeker (25.00%)
- Collective-minded (0.00%)

Employed

- Digital trend follower (34.29%)
- Strategic niche-seeker (24.76%)
- Collective-minded (21.90%)
- Ethical perfectionist (19.05%)

Student

- Ethical perfectionist (33.93%)
- Strategic niche-seeker (30.36%)
- Collective-minded (23.21%)
- Digital trend follower (12.50%)

Partial conclusion: The bivariate analysis between consumer clusters and employment status (Q45) shows a marginally non-significant association (p-value > 0.05 (i.e. = 0.0585)). Some notable differences emerge: the Digital Trend Follower cluster has the highest share of employed respondents (34.29%) and the Ethical Perfectionist cluster shows a higher proportion of students (33.93%). The Collective-Minded cluster is more represented among employed respondents (63.89%), while the Strategic Niche-Seeker also concentrates among employed (59.09%).
However, these differences do not reach conventional significance levels, suggesting that employment status alone does not fully explain cluster membership.

PERFUME USAGE FREQUENCY BY CLUSTERS

```
        Pearson's Chi-squared test

data:  freq_usage_cluster
X-squared = 6.5076, df = 6, p-value = 0.3688
```

A Chi-squared test was conducted to examine the distribution of perfume usage frequency across the four identified behavioral clusters.
The test yielded $X^2 = 6.5076$, df = 6, with a p-value = 0.3688, indicating no statistically significant association between perfume usage and cluster membership. In other words, the observed differences again could be due to chance.

	Cluster				
Usage Frequency	**Collective-minded**	**Ethical perfectionist**	**Digital trend follower**	**Strategic niche-seeker**	
					Row total
Occasionally					
Count	3	7	5	9	24
Row percent	12,50%	29,17%	20,83%	37,50%	
Column percent	8,33%	17,07%	11,63%	20,45%	
Total percent	1,83%	4,27%	3,05%	5,49%	
Every day					
Count	28	22	28	26	104
Row percent	26,92%	21,15%	26,92%	25,00%	
Column percent	77,78%	53,66%	65,12%	59,09%	
Total percent	17,07%	13,41%	17,07%	15,85%	
More times a week					
Count	5	12	10	9	36
Row percent	13,89%	33,33%	27,78%	25,00%	
Column percent	13,89%	29,27%	23,26%	20,45%	
Total percent	3,05%	7,32%	6,10%	5,49%	
Column total count	36	41	43	44	164

Cluster analysis

- **Collective-minded:** Every day users (77.78%), Occasional users (8.33%), More times a week users (13.89%)
- **Ethical perfectionist:** Every day users (53.66%), More times a week users (41.38%), Occasional users (17.07%);
- **Digital trend follower:** Every day users (65.12%), More times a week users (23.26%), Occasional users (11.63%);
- **Strategic niche-seeker:** Every day users (59.09%), More times a week users (20.45%), Occasiona users(20.45%)

Usage frequency analysis

Every day users

- Collective-minded: 26.92%
- Ethical perfectionist: 21.15%
- Digital trend follower: 26.92%
- Strategic niche-seeker: 25.00%

More times a week users

- Collective-minded: 13.89%
- Ethical perfectionist: 33.33%
- Digital trend follower: 27.78%
- Strategic niche-seeker: 25.00%

Occasional users

- Collective-minded: 12.50%
- Ethical perfectionist: 29.17%
- Digital trend follower: 20.83%
- Strategic niche-seeker: 37.50%

Although some differences in usage frequency across clusters are observable, the ANOVA test revealed **no statistically significant** association between cluster membership and perfume usage frequency. Nonetheless, a few tendencies emerge from the data: e**veryday use is relatively evenly distributed**, with slightly higher rates among **Collective-minded** and **Digital trend followers (both 26.92%)**, **more frequent use** appears to be more common among **Ethical perfectionists (33.33%)** and **Digital trend followers (27.78%)**. **Occasional** users are more concentrated in the **Strategic niche-seeker** cluster (37.50%). These patterns may reflect differences in routines or lifestyle attitudes, but given the lack of statistical significance, they should be interpreted cautiously and not generalized.

CLUSTER CHARACTERISTICS CONCLUSIONS

COLLECTIVE-MINDED

- Primarily based in **Rome (47.22%)**, followed by Vicenza (27.78%) and Milan (25%);
- Age distribution is balanced, with 52.78% aged 50–65 and 47.22% aged 18–30;
- The gender split is nearly equal, with a slight female majority (52.78%);
- Most members are employed (63.89%) or students (36.11%);
- Educational attainment is relatively high, with over 91% holding at least a high school diploma.
- Perfume use is frequent, with 77.78% using it daily, one of the highest among all clusters.

ETHICAL PERFECTIONIST

- Predominantly based in **Milan** (43.9%), followed by Rome (34.15%) and Vicenza (21.95%).
- It’s the youngest group, with 56.1% aged 18–30
- The gender distribution is balanced and split (51.22% F, 48.78% M).
- The majority are either students (46.34%) or employed (48.78%),
- The group is **highly educated**, with nearly 59% holding a college degree, it's the second most educated cluster
- Fragrance use is also high: over 53% use it daily, and 41.38% use it several times per week.

CLUSTER CHARACTERISTICS CONCLUSIONS

DIGITAL TREND FOLLOWER

- This group is geographically, fairly evenly split, with 36.36% living in Vicenza, 34.09% in Milan, and 29.55% in Rome;
- Mostly composed of individuals aged between 50 and 65 (77.27%) ;
- The gender is predominantly female, 63,64% women and 36,36% men;
- According to age the majority are employed (81.82%) with few students;
- The distribution of education presents a college degree (52.27%) or high school diploma (43.18%)
- Fragrance usage is high, with nearly 89% wearing perfume every day (65.12%) or multiple times a week (23.26%)

STRATEGIC NICHE-SEEKER

- Most members live in Vicenza (38.64%), followed by Rome (31.82%) and Milan (29.55%)
- Age is evenly split: 47.73% aged 18–30, 52.27% aged 50–65
- The gender is predominantly female 59.09% with 40,91% male
- Includes both employed (59.09%) and students (38.64%)
- Highest education level: 65.91% hold a college degree, 34.09% have a high school diploma
- Perfume usage is high: 59.09% use it daily, 20.45% multiple times per week or occasionally

8. CONCLUSIONS

8.1 OUR FINDINGS

- EXPLORATORY ANALYSIS RESULTS
- CLUSTER RESULTS

8.2 STRATEGIC IMPLICATIONS & LIMITATIONS

- BUSINESS OPPORTUNITY
- ANALYSIS LIMITATIONS

OUR FINDINGS

EXPLORATORY ANALYSIS RESULTS

- Our analysis highlights key insights into luxury fragrance consumers. First, **usage habits** are strong and frequent, with **over 80% wearing perfume multiple times a week** and favoring **larger, longer-lasting formats like 100ml** bottles. Preferences are evenly distributed across fragrance notes, with no single scent type standing out. Among the drivers of choice, **fragrance notes** take the lead, followed by **longevity**. Price sensitivity and niche options play only a secondary role in the decision-making process.
- Consumers show a clear preference for **in-store purchases (86%)**, valuing personal service and **testing**, though a minority values **online** convenience for **delivery** and **accessibility**.
- **Social media** has limited direct impact, with **personal recommendations** remaining more influential. Other **trends** like **sustainability** (80.6% preferring refillable options) and **inclusiveness** (interest in unisex perfumes) are growing worth leveraging.
- Dior enjoys a **strong brand perception** (85.1%), but only 41.4% have actually used its fragrances, suggesting untapped potential. Satisfaction is good but not optimal, as reflected in a **negative NPS (-5.1%)**, calling for better customer engagement.

CLUSTER RESULTS

The consumer base divides into four distinct clusters:

1. The **Collective-minded (21.8%)** are older, balanced in gender, and strongly influenced by word-of-mouth, showing daily use but low engagement with digital channels or innovation.
2. The **Ethical perfectionists (24.9%)** are younger, highly educated, and the most valuable segment: they are engaged, demanding, and willing to pay more for features like fragrance quality, ethical values, and sustainability, with very frequent use.
3. The **Digital trend followers (26.7%)** are mostly older and female, heavy users yet skeptical and resistant to marketing, preferring neutral and authentic messaging over traditional or social media appeals.
4. Finally, the **Strategic niche-seekers (26.7%)** are highly educated, selective, and digitally savvy: they rely on research and comparisons, prioritize product performance and value, and are less swayed by emotional or social influences.

These profiles highlight the importance of differentiated strategies to address each group’s specific motivations and barriers.

STRATEGICAL IMPLICATIONS & LIMITATIONS

BUSINESS OPPORTUNITY

- Our research highlights clear opportunities for Dior to strengthen its market position by **addressing gaps** and **leveraging emerging trends**. Consumers already **view Dior as a premium brand, but low actual usage and weak loyalty (NPS –5.1%)** point to the need for stronger engagement and conversion.
- We recommend maintaining the strong **focus on in-store experiences**, which remain the dominant and most valued channel, enhancing them with **personalized service** and expert consultation. At the same time, invest in a seamless omnichannel strategy to **meet growing expectations for online convenience** and accessibility, ensuring consistent messaging across physical and digital touchpoints. Messaging should **highlight** product quality, longevity, and distinctive fragrance notes, which remain the **top drivers of choice**.
- Sustainability and inclusiveness, already growing in relevance, should be framed as premium attributes to strengthen Dior's aspirational image. **Refillable formats and unisex options** can be positioned as desirable innovations rather than mere trends.
- Price sensitivity suggests the need to **clearly communicate Dior's value proposition**, potentially through selective trials, discovery sets, or exclusive offers that invite non-users to experience the brand without compromising its prestige.
- Finally, **strategies** should be **tailored to the four identified consumer clusters**. Engage *Ethical Perfectionists* with sustainability and ethical claims, reassure, *Collective-minded* consumers with familiarity and trust-building, rebuild confidence among *Digital Trend Followers* with authentic, transparent communication, and attract *Strategic Niche-Seekers* through clear, data-driven value demonstrations.
- This integrated approach aligns with current consumer priorities, addresses barriers, and leverages Dior's premium positioning while responding to evolving expectations.

LIMITATIONS

- The analysis provides valuable insights but has some limitations. The **sample** is **small** and **not fully representative**, with an **over-representation** of younger, highly educated, and employed respondents, and an **under-representation** of older and less-educated individuals. Income data are incomplete and geographic balance is uneven. Finally not all **age groups** are represented with 30-50 age group missing and also not all Italians citiziens are represented including only people from Milan, Vicenza and Rome.
- Some correlations, though significant, are weak and **may not fully reflect real-world** behaviors but only tailored to datas.
- Finally, **emerging trends and fast-evolving preferences may change over time**, so results should be interpreted as indicative rather than definitive.

THANKS FOR YOUR ATTENTION
